2019

Maximum or minimum value of a quadratic function

- Let $f(x) = ax^2 + bx + c$ - quadratic ($a \neq 0$).
- Let D be the discriminant $D = b^2 - 4ac$.

$$f(x) = a \left(x - \left(-\frac{b}{2a} \right) \right)^2 - \frac{D}{4a} \quad \left| \text{complete the square} \right.$$

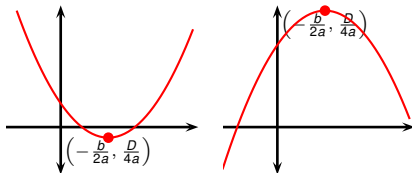

- Therefore if $a > 0$ then $f(x) = a(\text{square}) - \frac{D}{4a} \geq -\frac{D}{4a}$.
- Similarly if $a < 0$ then $f(x) = a(\text{square}) - \frac{D}{4a} \leq -\frac{D}{4a}$.

Recall $f(x) = ax^2 + bx + c = a \left(x - \left(-\frac{b}{2a} \right) \right)^2 - \frac{D}{4a}$.

Proposition

Let $f(x) = ax^2 + bx + c$, $a \neq 0$ and let $D = b^2 - 4ac$.

- If $a > 0$ then $f(x)$ has no maximum and has minimum at $x = -\frac{b}{2a}$.
- If $a < 0$ then $f(x)$ has no minimum and has maximum at $x = -\frac{b}{2a}$.
- In both cases, the extremal value (either maximum or minimum) is $f\left(-\frac{b}{2a}\right) = -\frac{b^2-4ac}{4a} = -\frac{D}{4a}$.

Example

Let x, z be two numbers that add to 12. Choose x and z so that the product $x \cdot z$ is maximal.

$$x + z = 12$$

$$z = 12 - x$$

Maximizing:

$$\begin{aligned} xz &= x(12 - x) \\ &= -x^2 + 12x \end{aligned}$$

Parabola opens down \Rightarrow has maximum, attained at:

$$\begin{aligned} x &= -\frac{b}{2a} \\ &= -\frac{12}{-2} = 6 \end{aligned}$$

$$z = 12 - x = 12 - 6 = 6$$

$$\text{Max. product} = xz = 6 \cdot 6 = 36.$$
