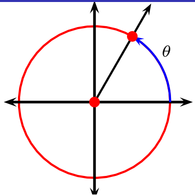
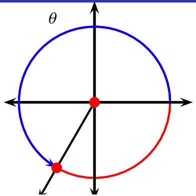
Outline

Definition of the trigonometric functions



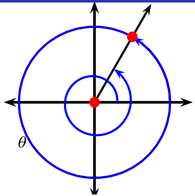
- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.

Definition of the trigonometric functions



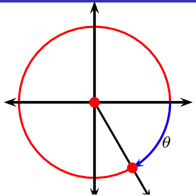
- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.

Definition of the trigonometric functions



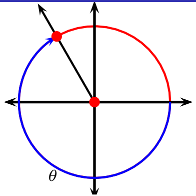
- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.

Definition of the trigonometric functions



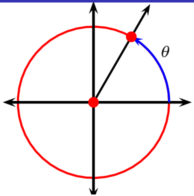
- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.

Definition of the trigonometric functions



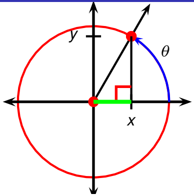
- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.

Definition of the trigonometric functions



- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.
- Let (x, y) be the intersection of the terminal arm of the geometric angle with the unit circle.

Definition of the trigonometric functions



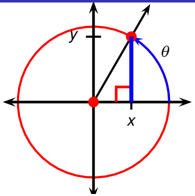
- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.
- Let (x, y) be the intersection of the terminal arm of the geometric angle with the unit circle.

Definition (sin and cos)

The sine and cosine functions of the angle θ, denoted by $\sin\theta$ and $\cos\theta$, are defined by

$$\cos\theta = x \qquad\qquad \sin\theta = y.$$

Definition of the trigonometric functions



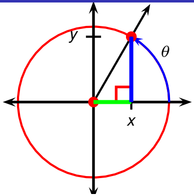
- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.
- Let (x, y) be the intersection of the terminal arm of the geometric angle with the unit circle.

Definition ($\sin$ and $\cos$)

The sine and cosine functions of the angle θ, denoted by $\sin\theta$ and $\cos\theta$, are defined by

$$\cos\theta = x \qquad \sin\theta = y.$$

Definition of the trigonometric functions



- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.
- Let (x, y) be the intersection of the terminal arm of the geometric angle with the unit circle.

Definition (sin and cos)

The sine and cosine functions of the angle θ, denoted by $\sin\theta$ and $\cos\theta$, are defined by

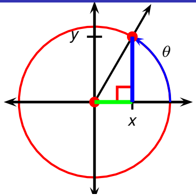
$$\cos\theta = x \qquad \sin\theta = y.$$

Definition (additional trigonometric functions)

The functions tangent, cotangent, secant and cosecant of the angle θ, denoted by $\tan\theta$, $\cot\theta$, $\sec\theta$, $\csc\theta$, are defined by

$$\tan\theta = \frac{\sin\theta}{\cos\theta} \qquad \cot\theta = \frac{\cos\theta}{\sin\theta} \qquad \sec\theta = \frac{1}{\cos\theta} \qquad \csc\theta = \frac{1}{\sin\theta}.$$

Definition of the trigonometric functions



- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.
- Let (x, y) be the intersection of the terminal arm of the geometric angle with the unit circle.

Definition (sin and cos)

The sine and cosine functions of the angle θ, denoted by $\sin\theta$ and $\cos\theta$, are defined by

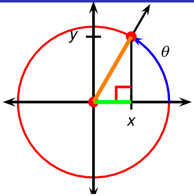
$$\cos\theta = x \qquad\qquad \sin\theta = y.$$

Definition (additional trigonometric functions)

The functions tangent, cotangent, secant and cosecant of the angle θ, denoted by $\tan\theta$, $\cot\theta$, $\sec\theta$, $\csc\theta$, are defined by

$$\tan\theta = \frac{\sin\theta}{\cos\theta} \qquad \cot\theta = \frac{\cos\theta}{\sin\theta} \qquad \sec\theta = \frac{1}{\cos\theta} \qquad \csc\theta = \frac{1}{\sin\theta}.$$

Definition of the trigonometric functions



- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.
- Let (x, y) be the intersection of the terminal arm of the geometric angle with the unit circle.

Definition (sin and cos)

The sine and cosine functions of the angle θ, denoted by $\sin\theta$ and $\cos\theta$, are defined by

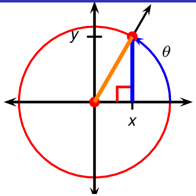
$$\cos\theta = x \qquad\qquad \sin\theta = y.$$

Definition (additional trigonometric functions)

The functions tangent, cotangent, secant and cosecant of the angle θ, denoted by $\tan\theta$, $\cot\theta$, $\sec\theta$, $\csc\theta$, are defined by

$$\tan\theta = \frac{\sin\theta}{\cos\theta} \qquad \cot\theta = \frac{\cos\theta}{\sin\theta} \qquad \sec\theta = \frac{1}{\cos\theta} \qquad \csc\theta = \frac{1}{\sin\theta}.$$

Definition of the trigonometric functions



- For an angle-measure θ we selected geometric angle with initial arm on x axis and terminal arm selected by traveling θ units on the unit circle.
- Let (x, y) be the intersection of the terminal arm of the geometric angle with the unit circle.

Definition (sin and cos)

The sine and cosine functions of the angle θ, denoted by $\sin\theta$ and $\cos\theta$, are defined by

$$\cos\theta = x \qquad \sin\theta = y.$$

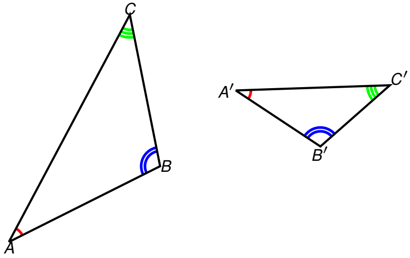
Definition (additional trigonometric functions)

The functions tangent, cotangent, secant and cosecant of the angle θ, denoted by $\tan\theta$, $\cot\theta$, $\sec\theta$, $\csc\theta$, are defined by

$$\tan\theta = \frac{\sin\theta}{\cos\theta} \qquad \cot\theta = \frac{\cos\theta}{\sin\theta} \qquad \sec\theta = \frac{1}{\cos\theta} \qquad \csc\theta = \frac{1}{\sin\theta}.$$

Definition (Similar triangles)

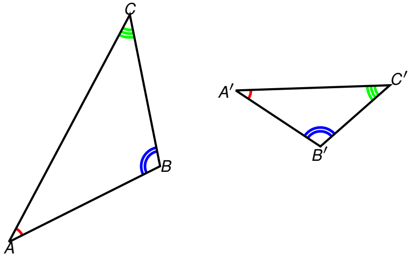
We say that a triangle $\triangle ABC$ is similar to a triangle $\triangle A'B'C'$ if the two triangles have equal angles.



Definition (Similar triangles)

We say that a triangle $\triangle ABC$ is similar to a triangle $\triangle A'B'C'$ if the two triangles have equal angles.

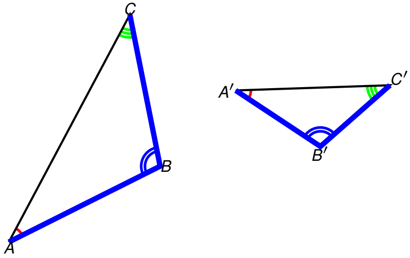
- The equal angles are assumed given in the same order for both triangles, that is, $\angle ABC = \angle A'B'C'$, $\angle BCA = \angle B'C'A'$, $\angle CAB = \angle C'A'B'$.



Definition (Similar triangles)

We say that a triangle $\triangle ABC$ is similar to a triangle $\triangle A'B'C'$ if the two triangles have equal angles.

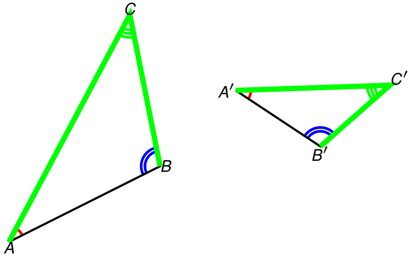
- The equal angles are assumed given in the same order for both triangles, that is, $\angle ABC = \angle A'B'C'$, $\angle BCA = \angle B'C'A'$, $\angle CAB = \angle C'A'B'$.



Definition (Similar triangles)

We say that a triangle $\triangle ABC$ is similar to a triangle $\triangle A'B'C'$ if the two triangles have equal angles.

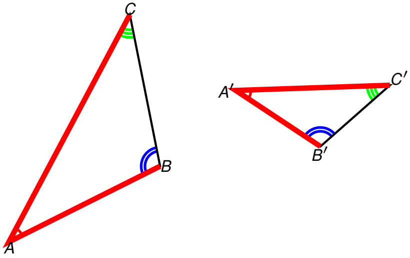
- The equal angles are assumed given in the same order for both triangles, that is, $\angle ABC = \angle A'B'C'$, $\angle BCA = \angle B'C'A'$, $\angle CAB = \angle C'A'B'$.



Definition (Similar triangles)

We say that a triangle $\triangle ABC$ is similar to a triangle $\triangle A'B'C'$ if the two triangles have equal angles.

- The equal angles are assumed given in the same order for both triangles, that is, $\angle ABC = \angle A'B'C'$, $\angle BCA = \angle B'C'A'$, $\angle CAB = \angle C'A'B'$.

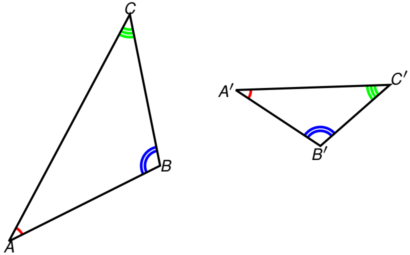


The following statement is proved in the subject of Euclidean (planar) geometry.

Theorem (Similar triangles have equal side ratios)

Let $\triangle ABC$ and $\triangle A'B'C'$ be two similar triangles. Then the ratios of the lengths of the sides of the two triangles are equal, that is

$$\frac{|AB|}{|BC|} = \frac{|A'B'|}{|B'C'|} \qquad \frac{|BC|}{|CA|} = \frac{|B'C'|}{|C'A'|} \qquad \frac{|CA|}{|AB|} = \frac{|C'A'|}{|A'B'|}$$

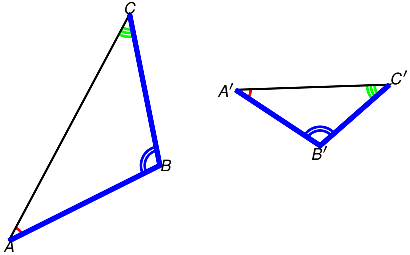


The following statement is proved in the subject of Euclidean (planar) geometry.

Theorem (Similar triangles have equal side ratios)

Let $\triangle ABC$ and $\triangle A'B'C'$ be two similar triangles. Then the ratios of the lengths of the sides of the two triangles are equal, that is

$$\frac{|AB|}{|BC|} = \frac{|A'B'|}{|B'C'|} \qquad \frac{|BC|}{|CA|} = \frac{|B'C'|}{|C'A'|} \qquad \frac{|CA|}{|AB|} = \frac{|C'A'|}{|A'B'|}$$

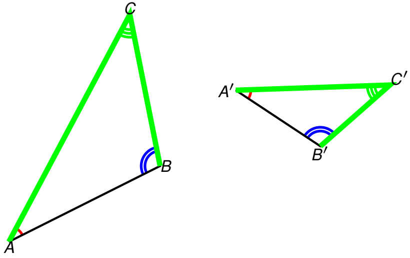


The following statement is proved in the subject of Euclidean (planar) geometry.

Theorem (Similar triangles have equal side ratios)

Let $\triangle ABC$ and $\triangle A'B'C'$ be two similar triangles. Then the ratios of the lengths of the sides of the two triangles are equal, that is

$$\frac{|AB|}{|BC|} = \frac{|A'B'|}{|B'C'|} \qquad \frac{|BC|}{|CA|} = \frac{|B'C'|}{|C'A'|} \qquad \frac{|CA|}{|AB|} = \frac{|C'A'|}{|A'B'|}$$

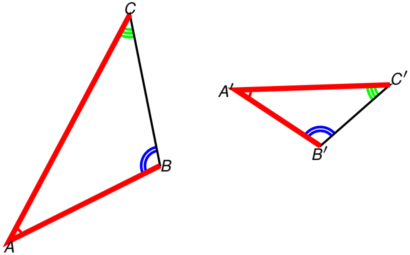


The following statement is proved in the subject of Euclidean (planar) geometry.

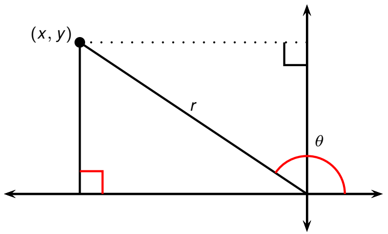
Theorem (Similar triangles have equal side ratios)

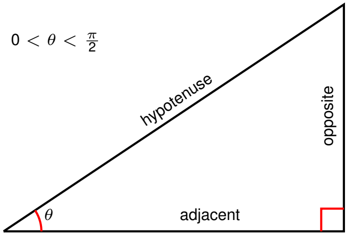
Let $\triangle ABC$ and $\triangle A'B'C'$ be two similar triangles. Then the ratios of the lengths of the sides of the two triangles are equal, that is

$$\frac{|AB|}{|BC|} = \frac{|A'B'|}{|B'C'|} \qquad \frac{|BC|}{|CA|} = \frac{|B'C'|}{|C'A'|} \qquad \frac{|CA|}{|AB|} = \frac{|C'A'|}{|A'B'|}$$



Trigonometric Functions and Right Angle Triangles

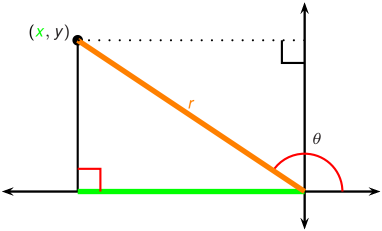


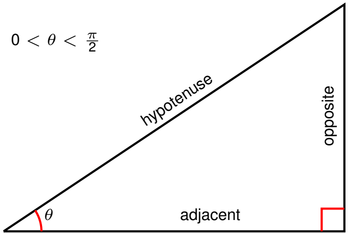


$\cos\theta$	$\sec\theta$	$\cos\theta$	$\sec\theta$
$\sin\theta$	$\csc\theta$	$\sin\theta$	$\csc\theta$
$\tan\theta$	$\cot\theta$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.

Trigonometric Functions and Right Angle Triangles

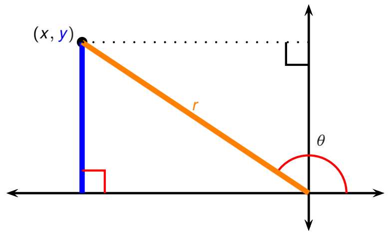


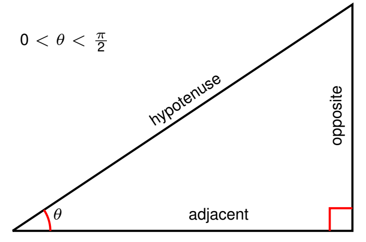


$\cos\theta = \frac{x}{r}$	$\sec\theta$	$\cos\theta$	$\sec\theta$
$\sin\theta$	$\csc\theta$	$\sin\theta$	$\csc\theta$
$\tan\theta$	$\cot\theta$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.

Trigonometric Functions and Right Angle Triangles

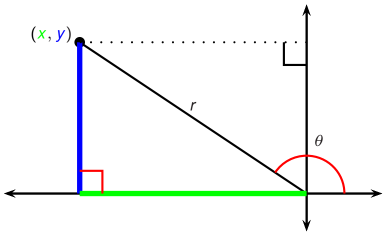


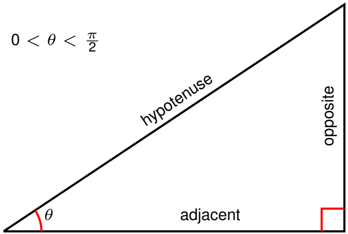


$\cos\theta = \frac{x}{r}$	$\sec\theta$	$\cos\theta$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta$	$\sin\theta$	$\csc\theta$
$\tan\theta$	$\cot\theta$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.

Trigonometric Functions and Right Angle Triangles

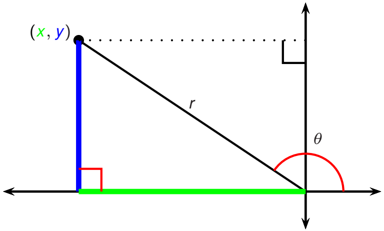


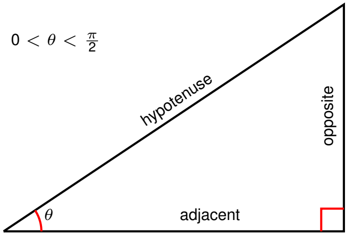


$\cos\theta = \frac{x}{r}$	$\sec\theta$	$\cos\theta$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta$	$\sin\theta$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.

Trigonometric Functions and Right Angle Triangles

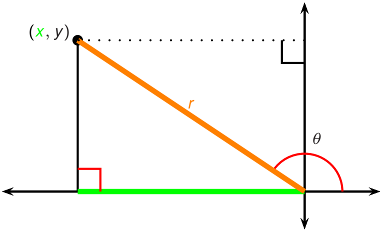


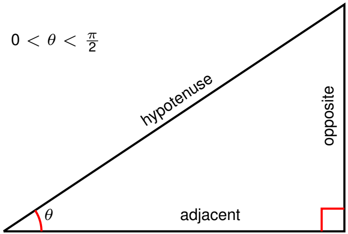


$\cos\theta = \frac{x}{r}$	$\sec\theta$	$\cos\theta$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta$	$\sin\theta$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.

Trigonometric Functions and Right Angle Triangles

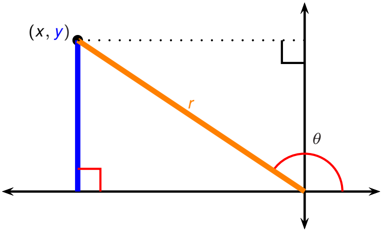


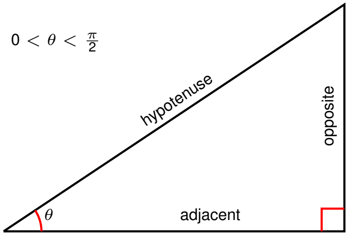


$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta$	$\sin\theta$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.

Trigonometric Functions and Right Angle Triangles

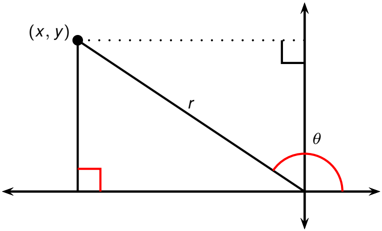


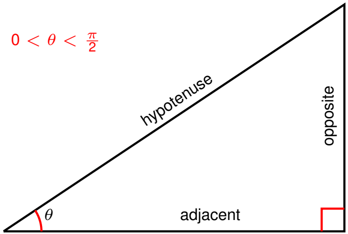


$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta = \frac{r}{y}$	$\sin\theta$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.

Trigonometric Functions and Right Angle Triangles

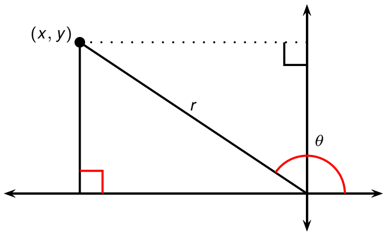


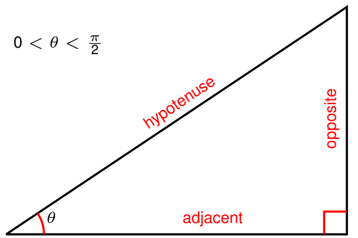


$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta = \frac{r}{y}$	$\sin\theta$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Trigonometric Functions and Right Angle Triangles

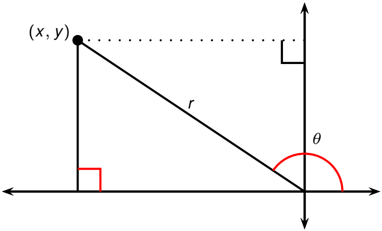


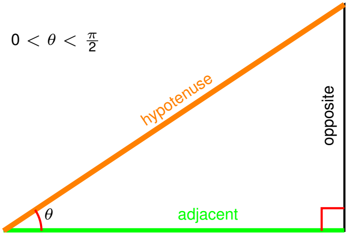


$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta = \frac{r}{y}$	$\sin\theta$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Trigonometric Functions and Right Angle Triangles

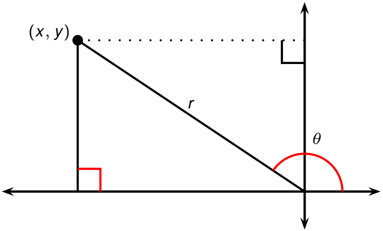


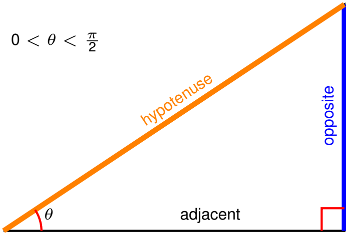


$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta = \frac{\text{adj}}{\text{hyp}}$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta = \frac{r}{y}$	$\sin\theta$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Trigonometric Functions and Right Angle Triangles

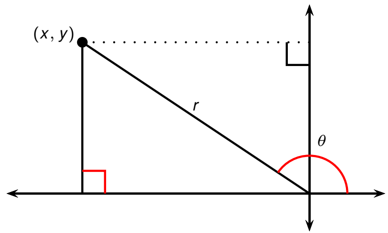


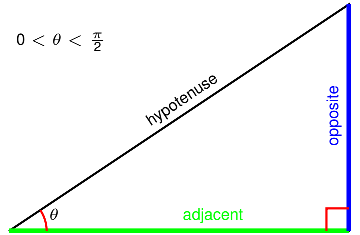


All angles		Acute angles	
$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta = \frac{\text{adj}}{\text{hyp}}$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta = \frac{r}{y}$	$\sin\theta = \frac{\text{opp}}{\text{hyp}}$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta$	$\cot\theta$

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Trigonometric Functions and Right Angle Triangles

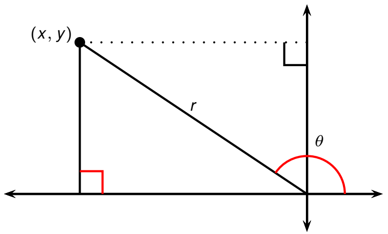


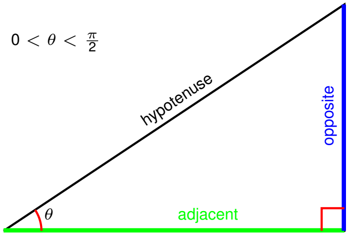


$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta = \frac{\text{adj}}{\text{hyp}}$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta = \frac{r}{y}$	$\sin\theta = \frac{\text{opp}}{\text{hyp}}$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta = \frac{\text{opp}}{\text{adj}}$	$\cot\theta$
All angles		Acute angles	

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Trigonometric Functions and Right Angle Triangles

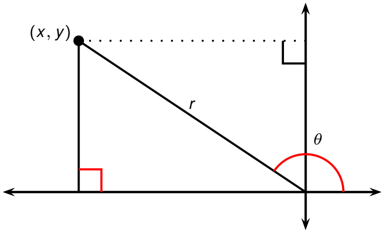




$\cos\theta = \frac{x}{r}$	$\sec\theta = \frac{r}{x}$	$\cos\theta = \frac{\text{adj}}{\text{hyp}}$	$\sec\theta$
$\sin\theta = \frac{y}{r}$	$\csc\theta = \frac{r}{y}$	$\sin\theta = \frac{\text{opp}}{\text{hyp}}$	$\csc\theta$
$\tan\theta = \frac{y}{x}$	$\cot\theta = \frac{x}{y}$	$\tan\theta = \frac{\text{opp}}{\text{adj}}$	$\cot\theta = \frac{\text{adj}}{\text{opp}}$
All angles		Acute angles	

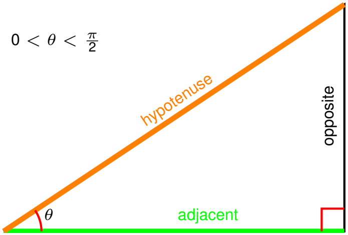
- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Trigonometric Functions and Right Angle Triangles



$$\cos\theta = \frac{x}{r} \qquad \sec\theta = \frac{r}{x}$$
$$\sin\theta = \frac{y}{r} \qquad \csc\theta = \frac{r}{y}$$
$$\tan\theta = \frac{y}{x} \qquad \cot\theta = \frac{x}{y}$$

All angles

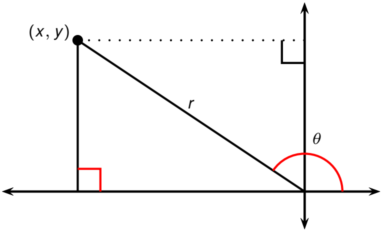


$$\cos\theta = \frac{\text{adj}}{\text{hyp}} \qquad \sec\theta = \frac{\text{hyp}}{\text{adj}}$$
$$\sin\theta = \frac{\text{opp}}{\text{hyp}} \qquad \csc\theta$$
$$\tan\theta = \frac{\text{opp}}{\text{adj}} \qquad \cot\theta = \frac{\text{adj}}{\text{opp}}$$

Acute angles

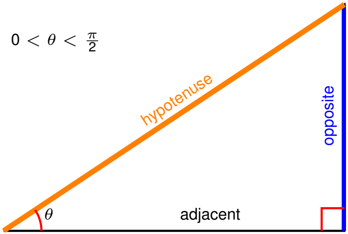
- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Trigonometric Functions and Right Angle Triangles



$$\cos\theta = \frac{x}{r} \qquad \sec\theta = \frac{r}{x}$$
$$\sin\theta = \frac{y}{r} \qquad \csc\theta = \frac{r}{y}$$
$$\tan\theta = \frac{y}{x} \qquad \cot\theta = \frac{x}{y}$$

All angles

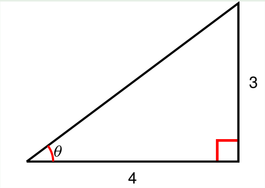


$$\cos\theta = \frac{\text{adj}}{\text{hyp}} \qquad \sec\theta = \frac{\text{hyp}}{\text{adj}}$$
$$\sin\theta = \frac{\text{opp}}{\text{hyp}} \qquad \csc\theta = \frac{\text{hyp}}{\text{opp}}$$
$$\tan\theta = \frac{\text{opp}}{\text{adj}} \qquad \cot\theta = \frac{\text{adj}}{\text{opp}}$$

Acute angles

- The trigonometric functions can be defined without requesting that the pt. (x, y) on the terminal arm of the angle lie on the unit circle.
- To do so we rescale by the distance r from the origin.
- The trig functions of acute θ (between 0 and $\frac{\pi}{2}$) can be interpreted as ratios of sides of right angle triangle with angle θ.

Example

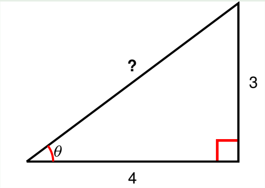


Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

$\sin\theta =$ $\quad$ $\cos\theta =$ $\quad$ $\tan\theta =$

$\csc\theta =$ $\quad$ $\sec\theta =$ $\quad$ $\cot\theta =$

Example



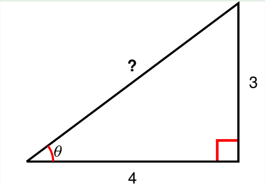
Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\sin\theta = \qquad \cos\theta = \qquad \tan\theta =$$

$$\csc\theta = \qquad \sec\theta = \qquad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

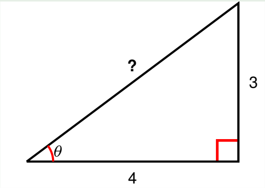
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \textbf{?}$$

$$\sin\theta = \qquad \cos\theta = \qquad \tan\theta =$$

$$\csc\theta = \qquad \sec\theta = \qquad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

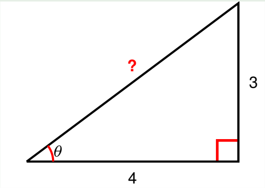
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \sqrt{4^2 + 3^2}$$

$$\sin\theta = \qquad \cos\theta = \qquad \tan\theta =$$

$$\csc\theta = \qquad \sec\theta = \qquad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

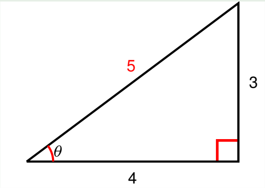
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25}$$

$$\sin\theta = \qquad \cos\theta = \qquad \tan\theta =$$

$$\csc\theta = \qquad \sec\theta = \qquad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

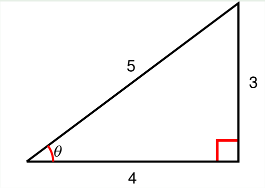
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

$$\sin\theta = \qquad \cos\theta = \qquad \tan\theta =$$

$$\csc\theta = \qquad \sec\theta = \qquad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

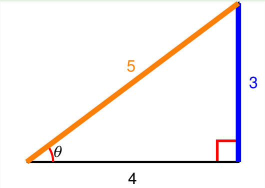
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \textbf{?} \qquad \cos\theta = \qquad \tan\theta =$$

$$\csc\theta = \qquad \sec\theta = \qquad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

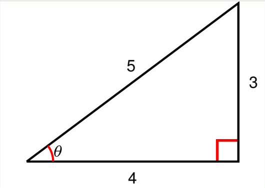
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \quad \tan\theta =$$

$$\csc\theta = \quad \sec\theta = \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

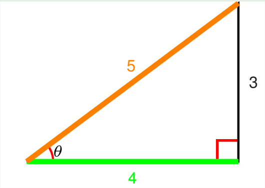
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \textbf{?} \quad \tan\theta =$$

$$\csc\theta = \quad \sec\theta = \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

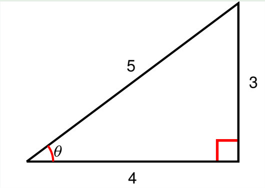
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta =$$
$$\csc\theta = \quad \sec\theta = \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

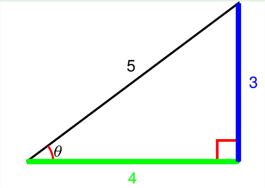
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta = \mathbf{?}$$

$$\csc\theta = \quad \sec\theta = \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

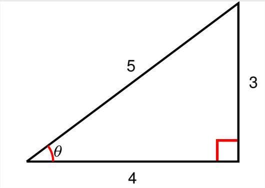
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta = \frac{3}{4}$$

$$\csc\theta = \quad \sec\theta = \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

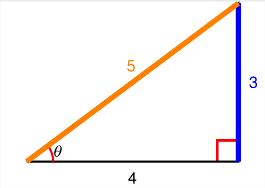
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta = \frac{3}{4}$$

$$\csc\theta = \mathbf{?} \quad \sec\theta = \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

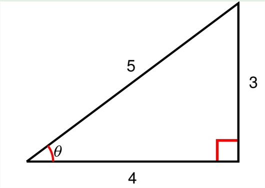
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\begin{array}{lll} \sin\theta = \frac{3}{5} & \cos\theta = \frac{4}{5} & \tan\theta = \frac{3}{4} \\ \csc\theta = \frac{5}{3} & \sec\theta = & \cot\theta = \end{array}$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

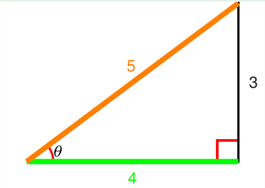
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta = \frac{3}{4}$$
$$\csc\theta = \frac{5}{3} \quad \sec\theta = \textbf{?} \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

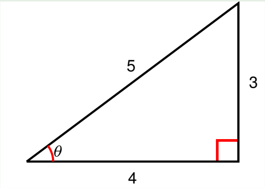
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta = \frac{3}{4}$$

$$\csc\theta = \frac{5}{3} \quad \sec\theta = \frac{5}{4} \quad \cot\theta =$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

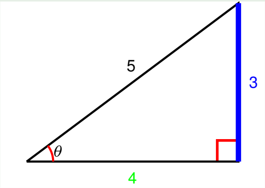
To find the trigonometric functions, we need to know the length of the hypotenuse.

$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta = \frac{3}{4}$$
$$\csc\theta = \frac{5}{3} \quad \sec\theta = \frac{5}{4} \quad \cot\theta = \mathbf{?}$$

Example



Let the angle θ be as indicated in the figure. Find the values of the six trigonometric functions of θ.

To find the trigonometric functions, we need to know the length of the hypotenuse.

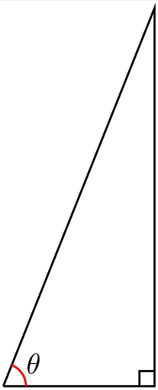
$$\text{hypotenuse} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.$$

Using the right angle triangle ratio interpretations of the trig functions, we can compute:

$$\sin\theta = \frac{3}{5} \quad \cos\theta = \frac{4}{5} \quad \tan\theta = \frac{3}{4}$$
$$\csc\theta = \frac{5}{3} \quad \sec\theta = \frac{5}{4} \quad \cot\theta = \frac{4}{3}$$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



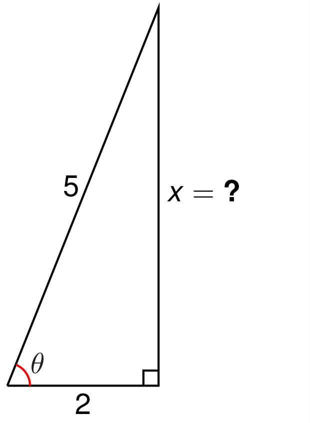
$\sin\theta =$ $\tan\theta =$

$\csc\theta =$ $\sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.

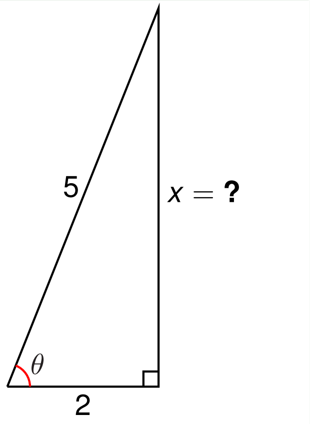
$\sin\theta =$ $\qquad\tan\theta =$

$\csc\theta =$ $\qquad\sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.

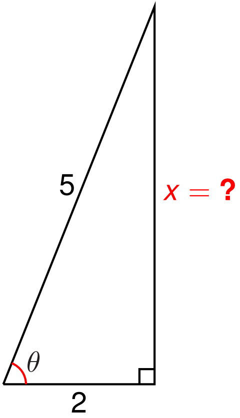
$\sin\theta =$ $\tan\theta =$

$\csc\theta =$ $\sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 =$ **?** , so $x =$ **?** .

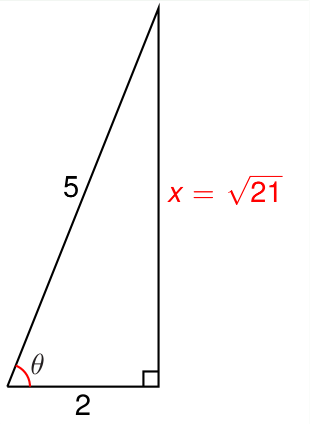
$\sin\theta =$ $\tan\theta =$

$\csc\theta =$ $\sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

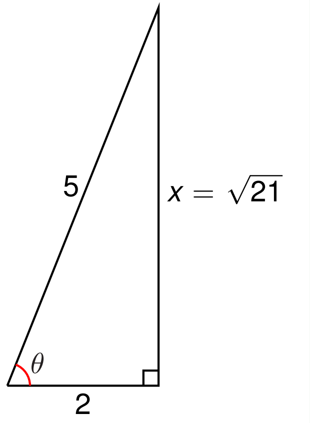
$\sin\theta =$ $\qquad$ $\tan\theta =$

$\csc\theta =$ $\qquad$ $\sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

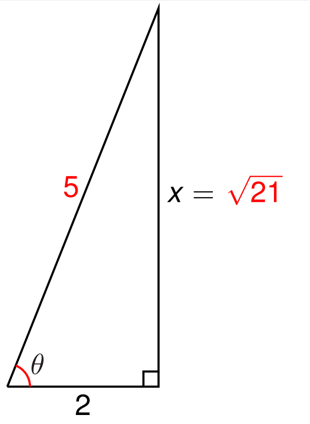
$\sin\theta = ?$ $\quad$ $\tan\theta =$

$\csc\theta =$ $\quad$ $\sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

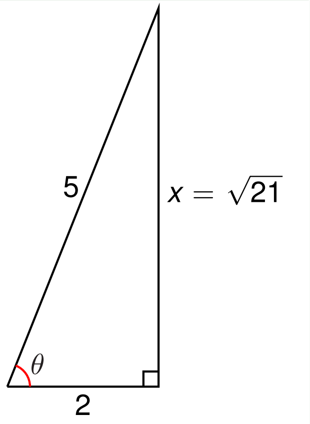
$\sin\theta = \frac{\sqrt{21}}{5}$ $\quad \tan\theta =$

$\csc\theta =$ $\quad \sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

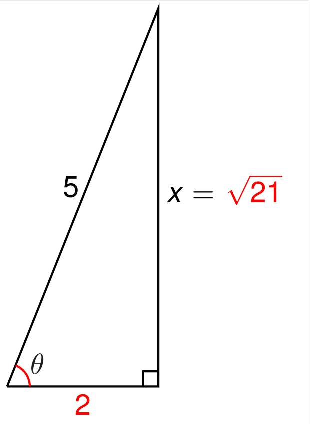
$\sin\theta = \frac{\sqrt{21}}{5}$ $\quad$ $\tan\theta =$ **?**

$\csc\theta =$ $\quad$ $\sec\theta =$

$\cot\theta =$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

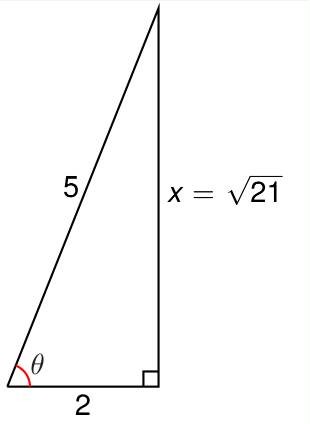
$$\sin\theta = \frac{\sqrt{21}}{5} \qquad \tan\theta = \frac{\sqrt{21}}{2}$$

$$\csc\theta = \qquad \sec\theta =$$

$$\cot\theta =$$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

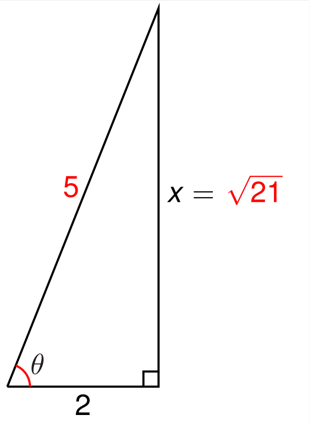
$$\sin\theta = \frac{\sqrt{21}}{5} \qquad \tan\theta = \frac{\sqrt{21}}{2}$$

$$\csc\theta = \textbf{?} \qquad \sec\theta =$$

$$\cot\theta =$$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

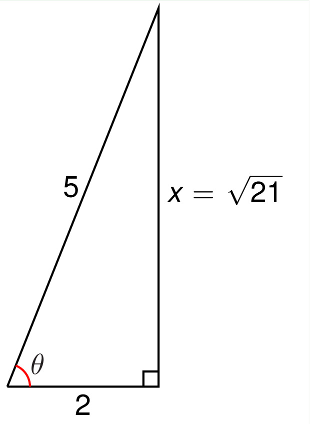
$$\sin\theta = \frac{\sqrt{21}}{5} \quad \tan\theta = \frac{\sqrt{21}}{2}$$

$$\csc\theta = \frac{5}{\sqrt{21}} \quad \sec\theta =$$

$$\cot\theta =$$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

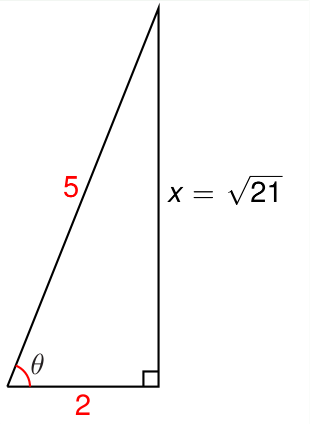
$$\sin\theta = \frac{\sqrt{21}}{5} \qquad \tan\theta = \frac{\sqrt{21}}{2}$$

$$\csc\theta = \frac{5}{\sqrt{21}} \qquad \sec\theta = \mathbf{?}$$

$$\cot\theta =$$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

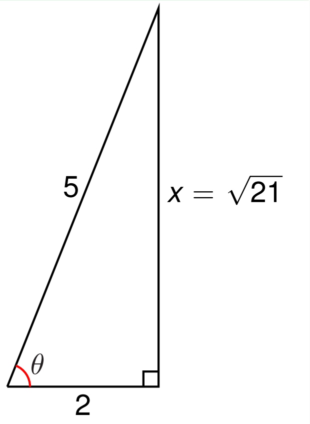
$$\sin\theta = \frac{\sqrt{21}}{5} \qquad \tan\theta = \frac{\sqrt{21}}{2}$$

$$\csc\theta = \frac{5}{\sqrt{21}} \qquad \sec\theta = \frac{5}{2}$$

$$\cot\theta =$$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.



- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

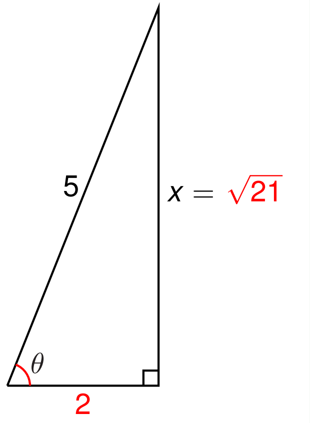
$$\sin\theta = \frac{\sqrt{21}}{5} \quad \tan\theta = \frac{\sqrt{21}}{2}$$

$$\csc\theta = \frac{5}{\sqrt{21}} \quad \sec\theta = \frac{5}{2}$$

$$\cot\theta = \textbf{?}$$

Example

If $\cos\theta = \frac{2}{5}$ and $0 < \theta < \frac{\pi}{2}$, find the other five trigonometric functions of θ.

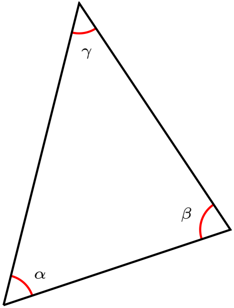


- Label the hypotenuse with length 5 and the adjacent side with length 2.
- Pythagorean theorem: $x^2 + 2^2 = 5^2$.
- Therefore $x^2 = 21$, so $x = \sqrt{21}$.

$$\sin\theta = \frac{\sqrt{21}}{5} \qquad \tan\theta = \frac{\sqrt{21}}{2}$$

$$\csc\theta = \frac{5}{\sqrt{21}} \qquad \sec\theta = \frac{5}{2}$$

$$\cot\theta = \frac{2}{\sqrt{21}}$$



Proposition

The angles of every triangle sum up to $\pi = 180°$.

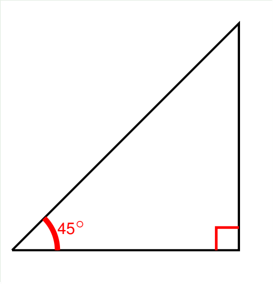
In other words, if α, β, γ are the angles indicated in the figure, then we have:

$$\alpha + \beta + \gamma = 180°.$$

Example

Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

Example

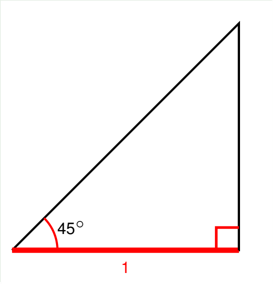


Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle,

.

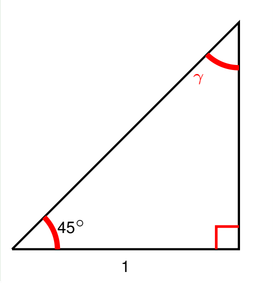
Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.

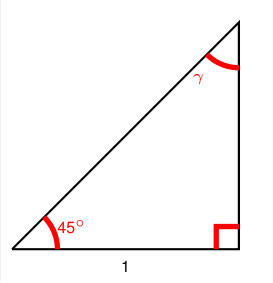
Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.

Example

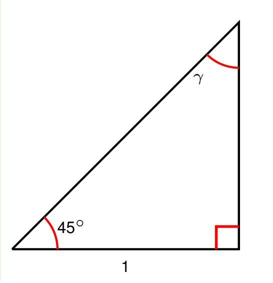


Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$45^\circ + 90^\circ + \gamma = 180^\circ$$

Example

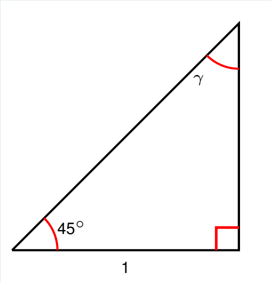


Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$45^\circ + 90^\circ + \gamma = 180^\circ$$

Example

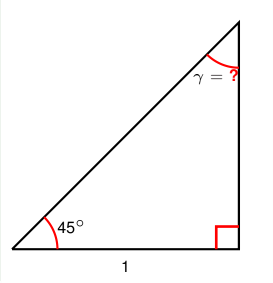


Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ \end{aligned}$$

Example

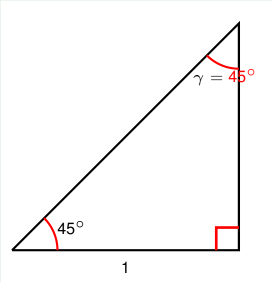


Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$
\begin{aligned}
45^\circ + 90^\circ + \gamma &= 180^\circ \\
\gamma &= 180^\circ - 90^\circ - 45^\circ = \mathbf{?}
\end{aligned}
$$

Example

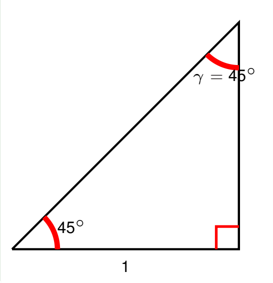


Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

Example



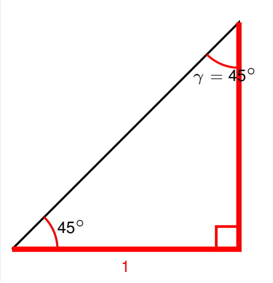
Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles

Example



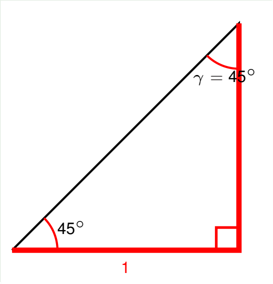
Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles

Example



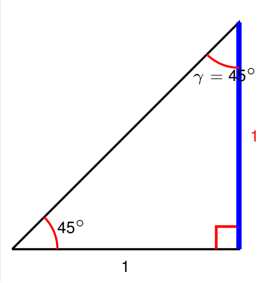
Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).

Example



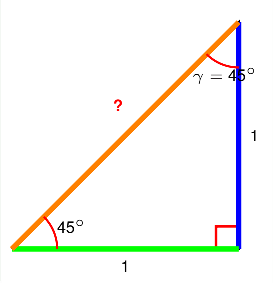
Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 .

Example



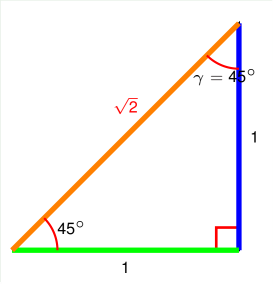
Find the values of $\sin 45^\circ$, $\cos 45^\circ$, $\tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $=$ **?** .

Example



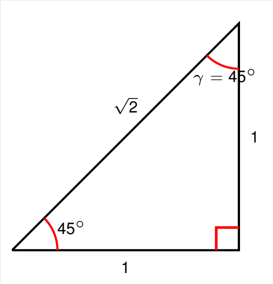
Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $= \sqrt{1^2 + 1^2} = \sqrt{2}$.

Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

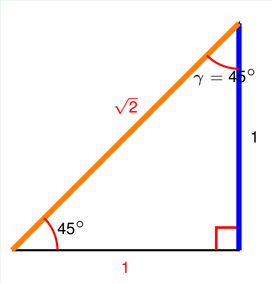
- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $= \sqrt{1^2 + 1^2} = \sqrt{2}$.
- $\sin 45^\circ = \textbf{?}$ $\qquad$ $\cos 45^\circ = \textbf{?}$

  $\tan 45^\circ = \textbf{?}$

Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

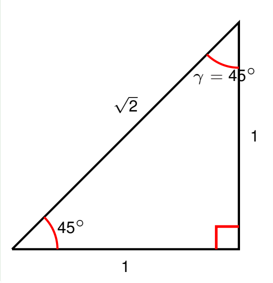
- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles$\Rightarrow$is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $= \sqrt{1^2 + 1^2} = \sqrt{2}$.
- $\sin 45^\circ = \frac{\text{opp}}{\text{hyp}} = \frac{\sqrt{2}}{2}$ $\qquad \cos 45^\circ = \textbf{?}$

  $\tan 45^\circ = \textbf{?}$

Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

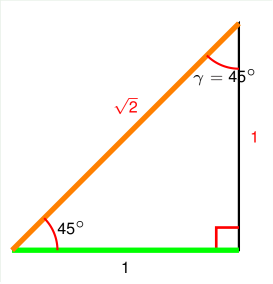
- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $= \sqrt{1^2 + 1^2} = \sqrt{2}$.
- $\sin 45^\circ = \dfrac{\text{opp}}{\text{hyp}} = \dfrac{\sqrt{2}}{2}$ $\qquad$ $\cos 45^\circ = \textbf{?}$

  $\tan 45^\circ = \textbf{?}$

Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

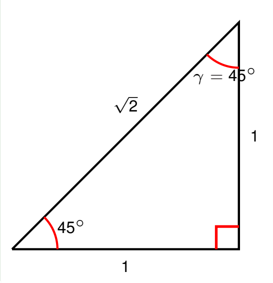
- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $= \sqrt{1^2 + 1^2} = \sqrt{2}$.
- $\sin 45^\circ = \frac{\text{opp}}{\text{hyp}} = \frac{\sqrt{2}}{2}$ $\quad$ $\cos 45^\circ = \frac{\text{adj}}{\text{hyp}} = \frac{\sqrt{2}}{2}$

  $\tan 45^\circ = $ **?**

Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

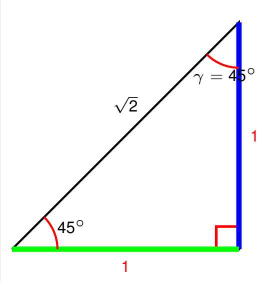
- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{array}{rcl} 45^\circ + 90^\circ + \gamma & = & 180^\circ \\ \gamma & = & 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{array}$$

- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $= \sqrt{1^2 + 1^2} = \sqrt{2}$.
- $\sin 45^\circ = \frac{\text{opp}}{\text{hyp}} = \frac{\sqrt{2}}{2} \qquad \cos 45^\circ = \frac{\text{adj}}{\text{hyp}} = \frac{\sqrt{2}}{2}$

  $\tan 45^\circ = \mathbf{?}$

Example



Find the values of $\sin 45^\circ, \cos 45^\circ, \tan 45^\circ$.

- Draw the 45° angle in right angle triangle, adjacent side of length 1.
- Let γ be the angle indicated on the plot.
- Angles in triangle sum to 180°:

$$\begin{aligned} 45^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 45^\circ = 45^\circ. \end{aligned}$$

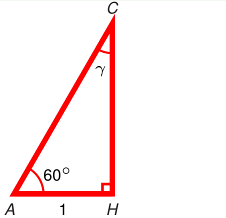
- Triangle has two equal angles $\Rightarrow$ is isosceles (has two equal sides).
- $\Rightarrow$ Opposite leg: length 1 $\Rightarrow$ length(hyp) $= \sqrt{1^2 + 1^2} = \sqrt{2}$.
- $\sin 45^\circ = \frac{\text{opp}}{\text{hyp}} = \frac{\sqrt{2}}{2}$ $\quad$ $\cos 45^\circ = \frac{\text{adj}}{\text{hyp}} = \frac{\sqrt{2}}{2}$

  $\tan 45^\circ = \frac{\text{opp}}{\text{adj}} = \frac{1}{1} = 1.$

Example

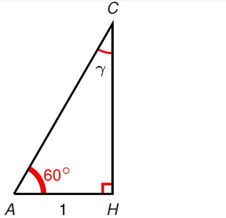
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated:

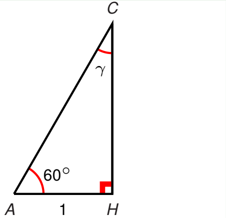
Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

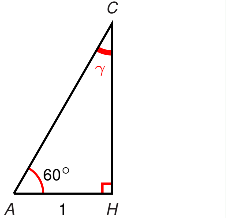
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$.

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ,$
$\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$.

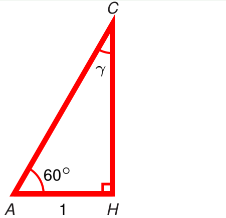
Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$.

Example

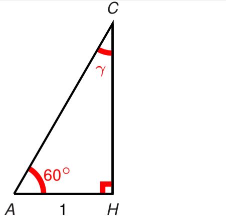


Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$60^\circ + 90^\circ + \gamma = 180^\circ$$

Example

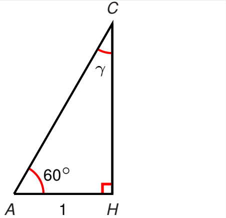


Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$60^\circ + 90^\circ + \gamma = 180^\circ$$

Example

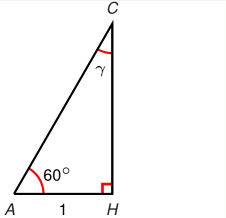


Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ \end{aligned}$$

Example

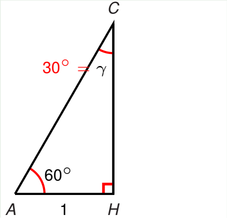


Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = \textbf{?} \end{aligned}$$

Example

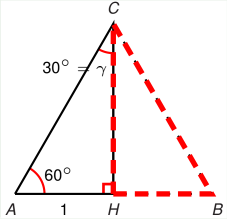


Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Example



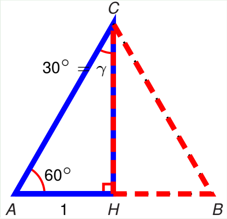
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$.

Example



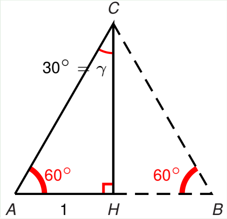
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$.

Example



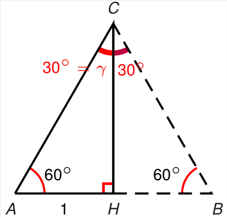
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$.

Example



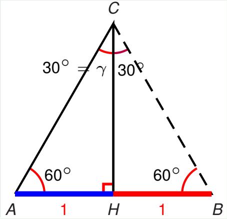
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$.

Example



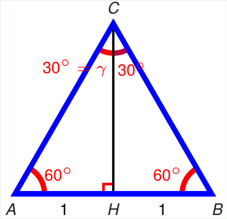
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$.

Example

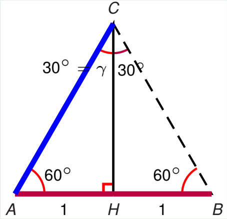


Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ,$
$\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ)$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

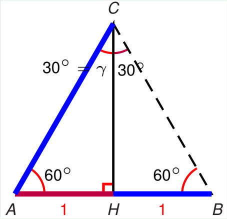
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$|AC| = |AB|$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

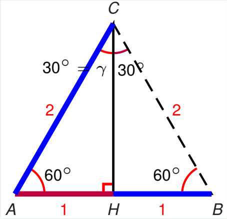
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$|AC| = |AB| = 1 + 1$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

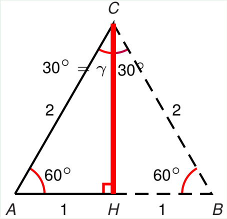
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ) \Rightarrow$ its sides are of equal length. Therefore

$$|AC| = |AB| = 1 + 1 = 2$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

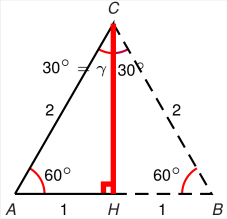
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ) \Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \textbf{?} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

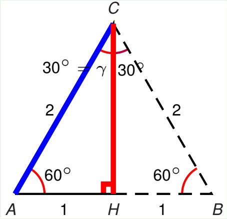
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

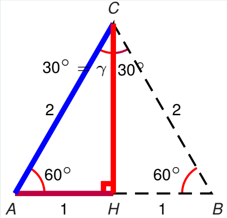
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{\color{red}{|AC|}^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

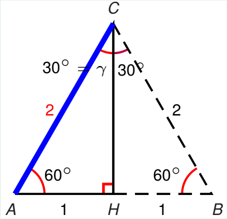
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} \qquad \Big| \text{ Pythagorean theorem} \end{aligned}$$

Example



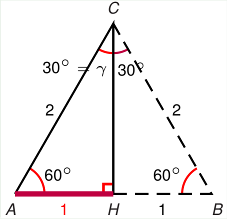
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} \end{aligned}$$

Example



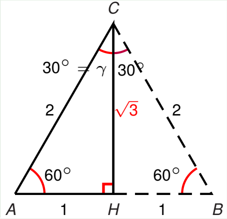
Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ) \Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - {\color{red}|AH|}^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - {\color{red}1}^2} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

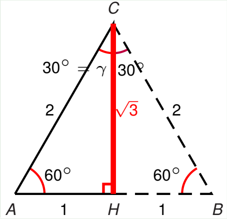
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} \qquad \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

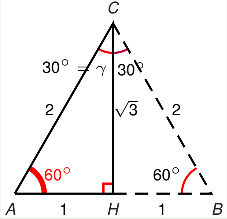
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

Example



Find the values of $\sin 60^\circ$, $\cos 60^\circ$, $\tan 60^\circ$, $\sin 30^\circ$, $\cos 30^\circ$, $\tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

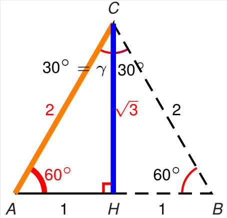
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big|\ \text{Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$\sin 60^\circ = \textbf{?}$ $\quad$ $\cos 60^\circ = \textbf{?}$ $\quad$ $\tan 60^\circ = \textbf{?}$

Example



Find the values of $\sin 60^\circ$, $\cos 60^\circ$, $\tan 60^\circ$, $\sin 30^\circ$, $\cos 30^\circ$, $\tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

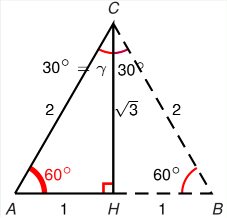
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ) \Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2} \qquad \cos 60^\circ = \textbf{?} \qquad \tan 60^\circ = \textbf{?}$$

Example



Find the values of $\sin 60^\circ$, $\cos 60^\circ$, $\tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

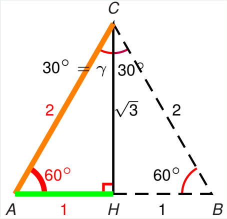
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2} \qquad \cos 60^\circ = \textbf{?} \qquad \tan 60^\circ = \textbf{?}$$

Example



Find the values of $\sin 60^\circ$, $\cos 60^\circ$, $\tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

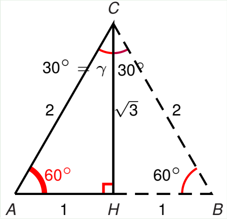
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2} \qquad \cos 60^\circ = \frac{1}{2} \qquad \tan 60^\circ = \textbf{?}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

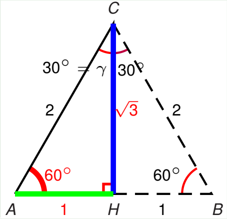
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2} \qquad \cos 60^\circ = \frac{1}{2} \qquad \tan 60^\circ = \textbf{?}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

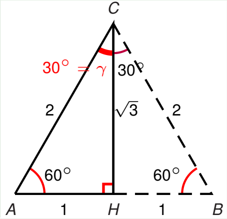
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} \qquad \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2} \qquad \cos 60^\circ = \frac{1}{2} \qquad \tan 60^\circ = \frac{\sqrt{3}}{1} = \sqrt{3}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

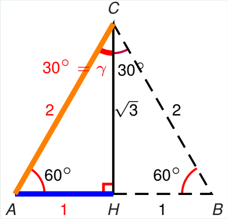
Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\sin 60^\circ = \frac{\sqrt{3}}{2} \qquad \cos 60^\circ = \frac{1}{2} \qquad \tan 60^\circ = \frac{\sqrt{3}}{1} = \sqrt{3}$$

$$\sin 30^\circ = \textbf{?} \qquad \cos 30^\circ = \textbf{?} \qquad \tan 30^\circ = \textbf{?}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ$, $\cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

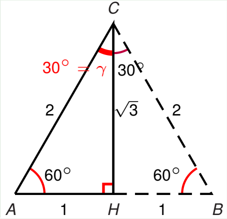
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\begin{aligned} \sin 60^\circ &= \frac{\sqrt{3}}{2} & \cos 60^\circ &= \frac{1}{2} & \tan 60^\circ &= \frac{\sqrt{3}}{1} = \sqrt{3} \\ \sin 30^\circ &= \frac{1}{2} & \cos 30^\circ &= \textbf{?} & \tan 30^\circ &= \textbf{?} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ$, $\cos 30^\circ$, $\tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

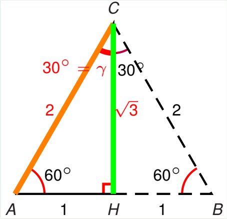
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ) \Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\begin{aligned} \sin 60^\circ &= \frac{\sqrt{3}}{2} & \cos 60^\circ &= \frac{1}{2} & \tan 60^\circ &= \frac{\sqrt{3}}{1} = \sqrt{3} \\ \sin 30^\circ &= \frac{1}{2} & \cos 30^\circ &= \textbf{?} & \tan 30^\circ &= \textbf{?} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ$, $\cos 30^\circ$, $\tan 30^\circ$.
Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

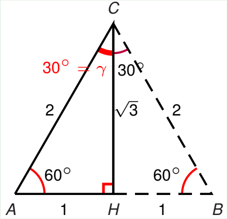
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ) \Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\begin{aligned} \sin 60^\circ &= \frac{\sqrt{3}}{2} & \cos 60^\circ &= \frac{1}{2} & \tan 60^\circ &= \frac{\sqrt{3}}{1} = \sqrt{3} \\ \sin 30^\circ &= \frac{1}{2} & \cos 30^\circ &= \frac{\sqrt{3}}{2} & \tan 30^\circ &= \textbf{?} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ,$ $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

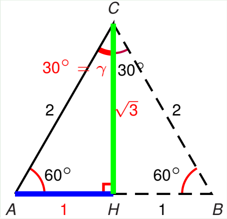
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles $(= 60^\circ) \Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} && \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\begin{aligned} \sin 60^\circ &= \frac{\sqrt{3}}{2} & \cos 60^\circ &= \frac{1}{2} & \tan 60^\circ &= \frac{\sqrt{3}}{1} = \sqrt{3} \\ \sin 30^\circ &= \frac{1}{2} & \cos 30^\circ &= \frac{\sqrt{3}}{2} & \tan 30^\circ &= \textbf{?} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

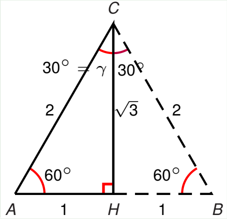
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} \quad \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\begin{aligned} \sin 60^\circ &= \frac{\sqrt{3}}{2} & \cos 60^\circ &= \frac{1}{2} & \tan 60^\circ &= \frac{\sqrt{3}}{1} = \sqrt{3} \\ \sin 30^\circ &= \frac{1}{2} & \cos 30^\circ &= \frac{\sqrt{3}}{2} & \tan 30^\circ &= \frac{1}{\sqrt{3}} \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

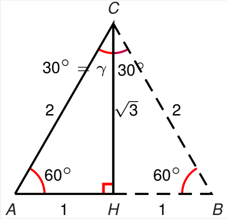
$$\begin{aligned} 60^\circ + 90^\circ + \gamma &= 180^\circ \\ \gamma &= 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{aligned}$$

Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{aligned} |AC| &= |AB| = 1 + 1 = 2 \\ |CH| &= \sqrt{|AC|^2 - |AH|^2} \qquad \Big| \text{ Pythagorean theorem} \\ &= \sqrt{2^2 - 1^2} = \sqrt{3} \end{aligned}$$

$$\begin{aligned} \sin 60^\circ &= \frac{\sqrt{3}}{2} & \cos 60^\circ &= \frac{1}{2} & \tan 60^\circ &= \frac{\sqrt{3}}{1} = \sqrt{3} \\ \sin 30^\circ &= \frac{1}{2} & \cos 30^\circ &= \frac{\sqrt{3}}{2} & \tan 30^\circ &= \frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}. \end{aligned}$$

Example



Find the values of $\sin 60^\circ, \cos 60^\circ, \tan 60^\circ$, $\sin 30^\circ, \cos 30^\circ, \tan 30^\circ$.

Construct a right angled $\triangle AHC$ as indicated: angles $60^\circ, 90^\circ, \gamma$. Angles in $\triangle$ sum to 180°:

$$\begin{array}{rcl} 60^\circ + 90^\circ + \gamma &=& 180^\circ \\ \gamma &=& 180^\circ - 90^\circ - 60^\circ = 30^\circ. \end{array}$$

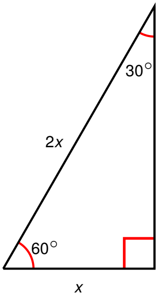
Construct $\triangle HBC$ as indicated so that $\triangle HBC \cong \triangle HAC$. $\triangle ABC$ has three equal angles ($= 60^\circ$) $\Rightarrow$ its sides are of equal length. Therefore

$$\begin{array}{rcll} |AC| &=& |AB| = 1 + 1 = 2 & \\ |CH| &=& \sqrt{|AC|^2 - |AH|^2} & \Big| \text{ Pythagorean theorem} \\ &=& \sqrt{2^2 - 1^2} = \sqrt{3} & \end{array}$$

$$\begin{array}{rclrclrcl} \sin 60^\circ &=& \frac{\sqrt{3}}{2} & \cos 60^\circ &=& \frac{1}{2} & \tan 60^\circ &=& \frac{\sqrt{3}}{1} = \sqrt{3} \\ \sin 30^\circ &=& \frac{1}{2} & \cos 30^\circ &=& \frac{\sqrt{3}}{2} & \tan 30^\circ &=& \frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}. \end{array}$$

Observation

- *If the hypotenuse of a right angle triangle is twice larger than one of the sides, then the angle opposite to that side is* 30°*.*
- *Conversely, in a right angle triangle with angle* 30°*, the hypotenuse is twice longer than the shorter of the two legs.*

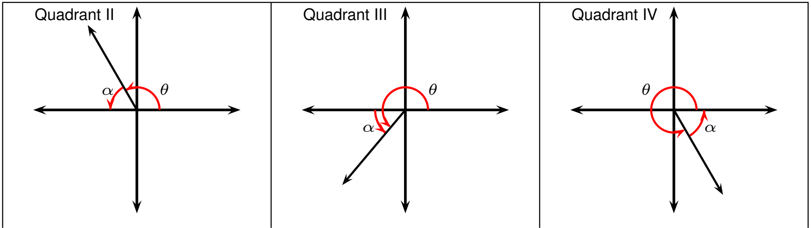


To compute trigonometric functions from obtuse ($> 90^\circ$) or negative angles, we can use the following visual aid.

Definition (Reference Angle)

Let θ be an angle in standard position. Its reference angle is the acute positive angle formed by the terminal arm and the x axis.

The computation of the reference angle α depends on the quadrant.



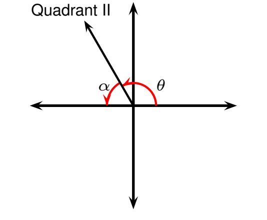
Quadrant II	Quadrant III	Quadrant IV
$\alpha = $ **?**	$\alpha =$	$\alpha =$
$\alpha = $ **?**	$\alpha =$	$\alpha =$

To compute trigonometric functions from obtuse ($> 90°$) or negative angles, we can use the following visual aid.

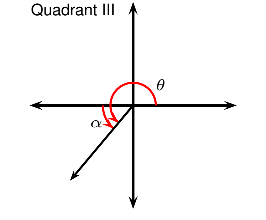
Definition (Reference Angle)

Let θ be an angle in standard position. Its reference angle is the acute positive angle formed by the terminal arm and the *x* axis.

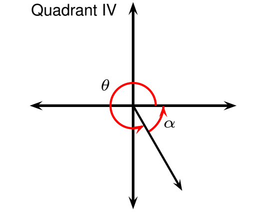
The computation of the reference angle α depends on the quadrant.



$$\alpha = \pi - \theta$$
$$\alpha = 180^\circ - \theta$$



$$\alpha =$$
$$\alpha =$$



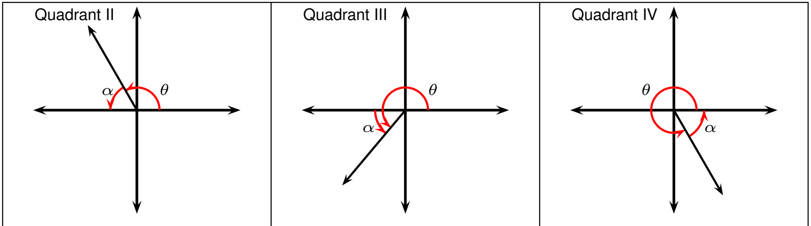
$$\alpha =$$
$$\alpha =$$

To compute trigonometric functions from obtuse ($> 90^\circ$) or negative angles, we can use the following visual aid.

Definition (Reference Angle)

Let θ be an angle in standard position. Its reference angle is the acute positive angle formed by the terminal arm and the *x* axis.

The computation of the reference angle α depends on the quadrant.



$\alpha = \pi - \theta$	$\alpha = ?$	$\alpha =$
$\alpha = 180^\circ - \theta$	$\alpha = ?$	$\alpha =$

To compute trigonometric functions from obtuse ($> 90^\circ$) or negative angles, we can use the following visual aid.

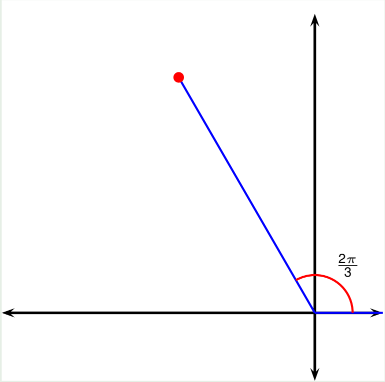
$\alpha = \pi - \theta$	$\alpha = \theta - \pi$	$\alpha = 2\pi - \theta$
$\alpha = 180^\circ - \theta$	$\alpha = \theta - 180^\circ$	$\alpha = 360^\circ - \theta$

Observation

One can find the value of a trigonometric function of θ as follows.

- *Find the reference angle α associated to θ.*
- *Find the trig function of α.*
- *Use the quadrant in which θ lies to affix an appropriate sign to the function value.*

Example

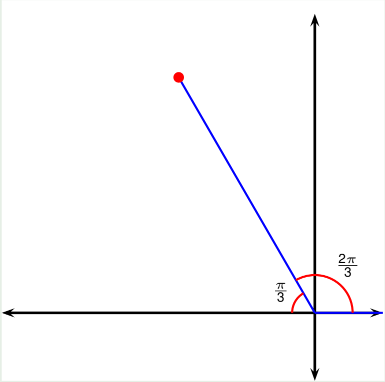


Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \qquad \cos\left(\frac{2\pi}{3}\right) = \qquad \tan\left(\frac{2\pi}{3}\right) =$$

$$\csc\left(\frac{2\pi}{3}\right) = \qquad \sec\left(\frac{2\pi}{3}\right) = \qquad \cot\left(\frac{2\pi}{3}\right) =$$

Example

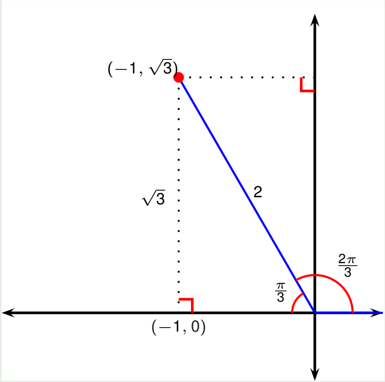


Find the exact values of the trigonometric functions of $\theta = \dfrac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \qquad \cos\left(\frac{2\pi}{3}\right) = \qquad \tan\left(\frac{2\pi}{3}\right) =$$

$$\csc\left(\frac{2\pi}{3}\right) = \qquad \sec\left(\frac{2\pi}{3}\right) = \qquad \cot\left(\frac{2\pi}{3}\right) =$$

Example

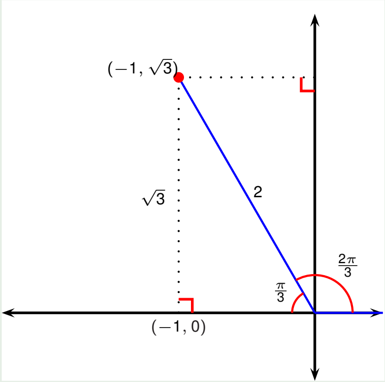


Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$\sin\left(\frac{2\pi}{3}\right) =$ $\cos\left(\frac{2\pi}{3}\right) =$ $\tan\left(\frac{2\pi}{3}\right) =$

$\csc\left(\frac{2\pi}{3}\right) =$ $\sec\left(\frac{2\pi}{3}\right) =$ $\cot\left(\frac{2\pi}{3}\right) =$

Example

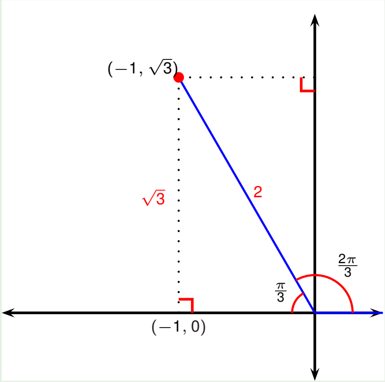


Find the exact values of the trigonometric functions of $\theta = \dfrac{2\pi}{3} = 120^\circ$.

$\sin\left(\dfrac{2\pi}{3}\right) = \textbf{?}$ $\cos\left(\dfrac{2\pi}{3}\right) =$ $\tan\left(\dfrac{2\pi}{3}\right) =$

$\csc\left(\dfrac{2\pi}{3}\right) =$ $\sec\left(\dfrac{2\pi}{3}\right) =$ $\cot\left(\dfrac{2\pi}{3}\right) =$

Example

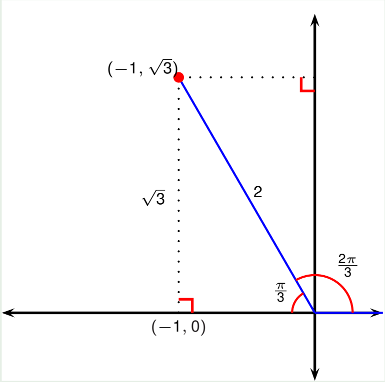


Find the exact values of the trigonometric functions of $\theta = \dfrac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \qquad \cos\left(\frac{2\pi}{3}\right) = \qquad \tan\left(\frac{2\pi}{3}\right) =$$

$$\csc\left(\frac{2\pi}{3}\right) = \qquad \sec\left(\frac{2\pi}{3}\right) = \qquad \cot\left(\frac{2\pi}{3}\right) =$$

Example

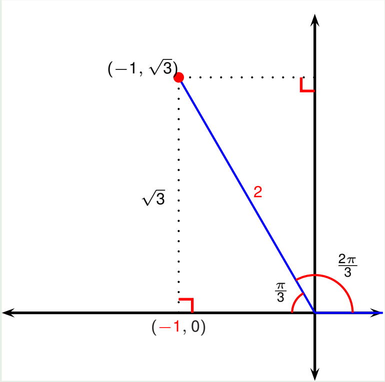


Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \quad \cos\left(\frac{2\pi}{3}\right) = \textbf{?} \quad \tan\left(\frac{2\pi}{3}\right) =$$

$$\csc\left(\frac{2\pi}{3}\right) = \quad \sec\left(\frac{2\pi}{3}\right) = \quad \cot\left(\frac{2\pi}{3}\right) =$$

Example

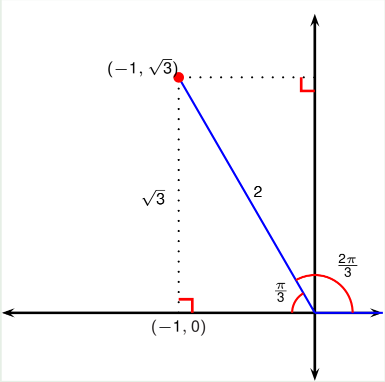


Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \qquad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \qquad \tan\left(\frac{2\pi}{3}\right) =$$

$$\csc\left(\frac{2\pi}{3}\right) = \qquad \sec\left(\frac{2\pi}{3}\right) = \qquad \cot\left(\frac{2\pi}{3}\right) =$$

Example

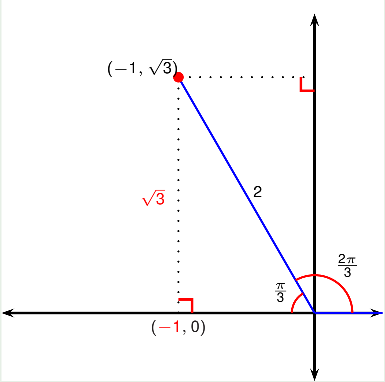


Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \qquad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \qquad \tan\left(\frac{2\pi}{3}\right) = \textbf{?}$$

$$\csc\left(\frac{2\pi}{3}\right) = \qquad \sec\left(\frac{2\pi}{3}\right) = \qquad \cot\left(\frac{2\pi}{3}\right) =$$

Example

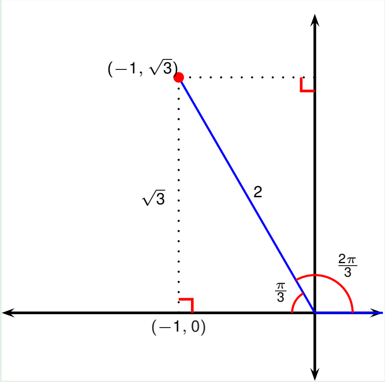


Find the exact values of the trigonometric functions of $\theta = \dfrac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \qquad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \qquad \tan\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\csc\left(\frac{2\pi}{3}\right) = \qquad \sec\left(\frac{2\pi}{3}\right) = \qquad \cot\left(\frac{2\pi}{3}\right) =$$

Example

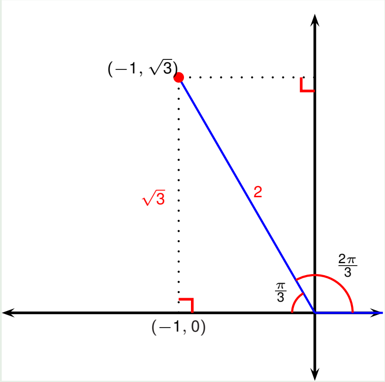


Find the exact values of the trigonometric functions of $\theta = \dfrac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \quad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \quad \tan\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\csc\left(\frac{2\pi}{3}\right) = \mathbf{?} \quad \sec\left(\frac{2\pi}{3}\right) = \quad \cot\left(\frac{2\pi}{3}\right) =$$

Example

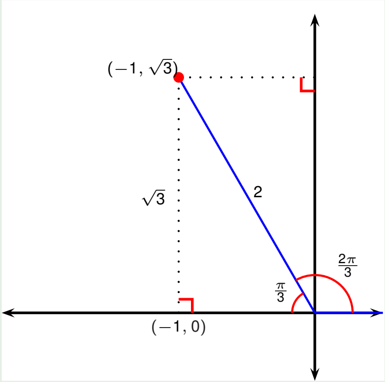


Find the exact values of the trigonometric functions of $\theta = \dfrac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \qquad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \qquad \tan\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\csc\left(\frac{2\pi}{3}\right) = \frac{2}{\sqrt{3}} \qquad \sec\left(\frac{2\pi}{3}\right) = \qquad \cot\left(\frac{2\pi}{3}\right) =$$

Example

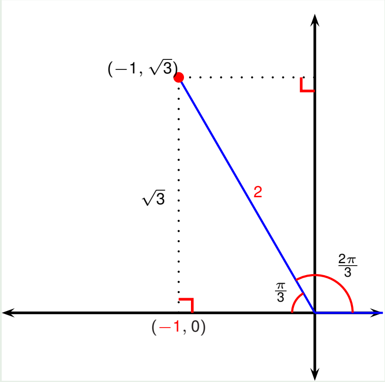


Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \quad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \quad \tan\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\csc\left(\frac{2\pi}{3}\right) = \frac{2}{\sqrt{3}} \quad \sec\left(\frac{2\pi}{3}\right) = \mathbf{?} \quad \cot\left(\frac{2\pi}{3}\right) =$$

Example

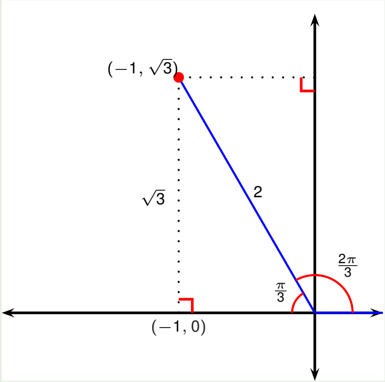


Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \quad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \quad \tan\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\csc\left(\frac{2\pi}{3}\right) = \frac{2}{\sqrt{3}} \quad \sec\left(\frac{2\pi}{3}\right) = -\frac{2}{1} = -2 \quad \cot\left(\frac{2\pi}{3}\right) =$$

Example

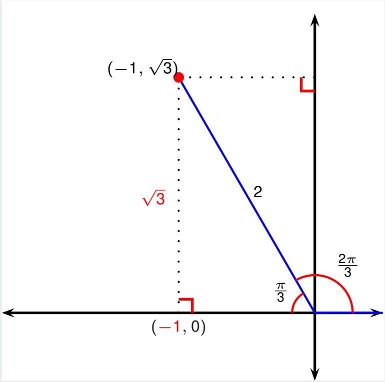


Find the exact values of the trigonometric functions of $\theta = \dfrac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \quad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \quad \tan\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\csc\left(\frac{2\pi}{3}\right) = \frac{2}{\sqrt{3}} \quad \sec\left(\frac{2\pi}{3}\right) = -\frac{2}{1} = -2 \quad \cot\left(\frac{2\pi}{3}\right) = \textbf{?}$$

Example



Find the exact values of the trigonometric functions of $\theta = \frac{2\pi}{3} = 120^\circ$.

$$\sin\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{2} \quad \cos\left(\frac{2\pi}{3}\right) = -\frac{1}{2} \quad \tan\left(\frac{2\pi}{3}\right) = \frac{\sqrt{3}}{-1} = -\sqrt{3}$$

$$\csc\left(\frac{2\pi}{3}\right) = \frac{2}{\sqrt{3}} \quad \sec\left(\frac{2\pi}{3}\right) = -\frac{2}{1} = -2 \quad \cot\left(\frac{2\pi}{3}\right) = -\frac{1}{\sqrt{3}}$$

- $\sin(\theta + 2\pi) = \sin\theta$.
- $\cos(\theta + 2\pi) = \cos\theta$.
- We say $\sin$ and $\cos$ are 2π-periodic.

Trigonometric Identities

Definition (Trigonometric Identity)

A trigonometric identity is an equality between the trigonometric functions in one or more variables that holds for all values of the involved variables in the domains of all of the expressions.

Trigonometric Identities

Definition (Trigonometric Identity)

A trigonometric identity is an equality between the trigonometric functions in one or more variables that holds for all values of the involved variables in the domains of all of the expressions.

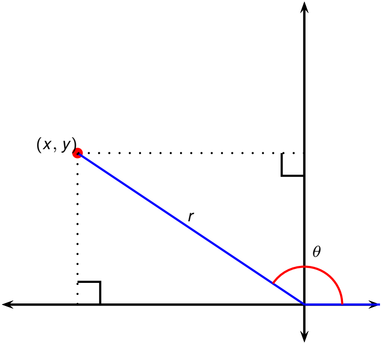
- By convention, when dealing with trigonometric identities we do not account for the domains of the involved expressions.

Trigonometric Identities

Definition (Trigonometric Identity)

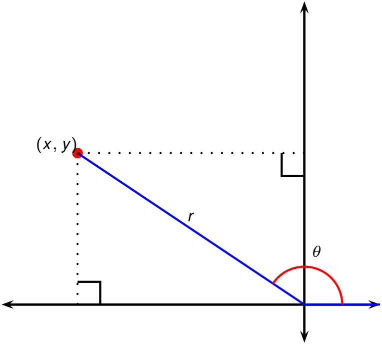
A trigonometric identity is an equality between the trigonometric functions in one or more variables that holds for all values of the involved variables in the domains of all of the expressions.

- By convention, when dealing with trigonometric identities we do not account for the domains of the involved expressions.
- For example, $\frac{\sin\theta}{\sin\theta} = 1$ is considered a valid trigonometric identity, although, when considered as a function, the left hand side is not defined for $\theta \neq 0$.

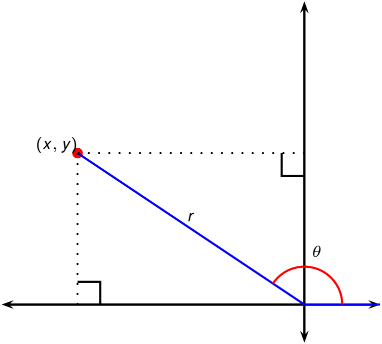


$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

- $\csc\theta = \frac{1}{\sin\theta}$
- $\sec\theta = \frac{1}{\cos\theta}$
- $\cot\theta = \frac{1}{\tan\theta}$
- $\tan\theta = \frac{\sin\theta}{\cos\theta}$
- $\cot\theta = \frac{\cos\theta}{\sin\theta}$

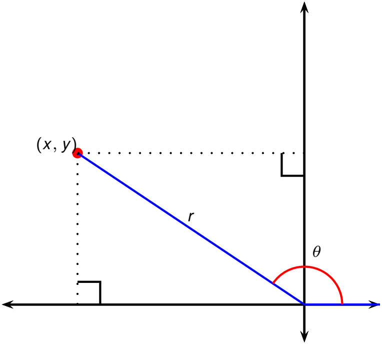


$$\begin{array}{ll} \sin\theta = \frac{y}{r} & \csc\theta = \frac{r}{y} \\ \cos\theta = \frac{x}{r} & \sec\theta = \frac{r}{x} \\ \tan\theta = \frac{y}{x} & \cot\theta = \frac{x}{y} \end{array}$$



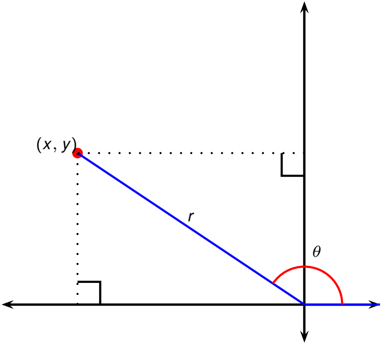
$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

$$\sin^2\theta + \cos^2\theta$$



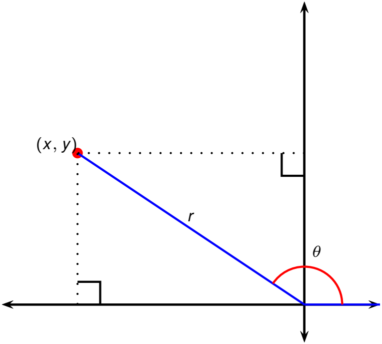
$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

$$\begin{aligned} & \sin^2\theta + \cos^2\theta \\ = \quad & \frac{y^2}{r^2} + \frac{x^2}{r^2} \end{aligned}$$



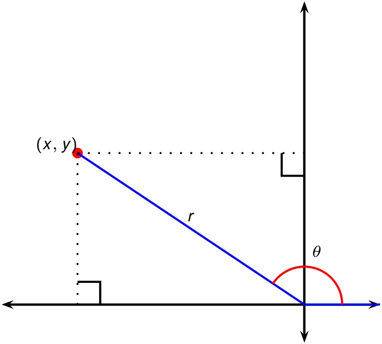
$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

$$\begin{aligned} & \sin^2\theta + \cos^2\theta \\ = \quad & \frac{y^2}{r^2} + \frac{x^2}{r^2} \\ = \quad & \frac{y^2 + x^2}{r^2} \end{aligned}$$



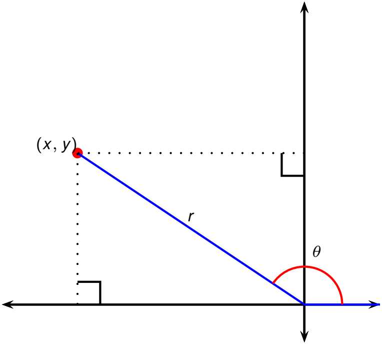
$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

$$\begin{aligned} & \sin^2\theta + \cos^2\theta \\ = & \frac{y^2}{r^2} + \frac{x^2}{r^2} \\ = & \frac{y^2 + x^2}{r^2} \\ = & \frac{r^2}{r^2} \end{aligned}$$



$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

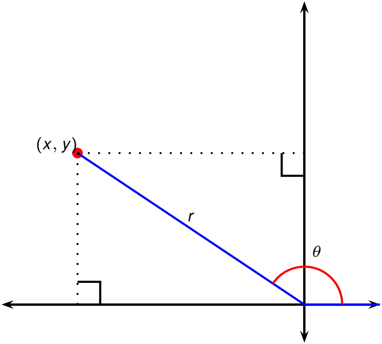
$$\begin{aligned} & \sin^2\theta + \cos^2\theta \\ = & \frac{y^2}{r^2} + \frac{x^2}{r^2} \\ = & \frac{y^2 + x^2}{r^2} \\ = & \frac{r^2}{r^2} \\ = & 1 \end{aligned}$$



$$\begin{array}{ll} \sin\theta = \frac{y}{r} & \csc\theta = \frac{r}{y} \\ \cos\theta = \frac{x}{r} & \sec\theta = \frac{r}{x} \\ \tan\theta = \frac{y}{x} & \cot\theta = \frac{x}{y} \end{array}$$

$$\begin{aligned} & \sin^2\theta + \cos^2\theta \\ = \quad & \frac{y^2}{r^2} + \frac{x^2}{r^2} \\ = \quad & \frac{y^2 + x^2}{r^2} \\ = \quad & \frac{r^2}{r^2} \\ = \quad & 1 \end{aligned}$$

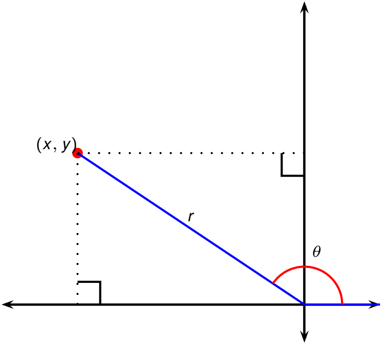
Therefore $\sin^2\theta + \cos^2\theta = 1$.



$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

Example ($\tan^2\theta + 1 = \sec^2\theta$)

Prove the identity
$\tan^2\theta + 1 = \sec^2\theta$.

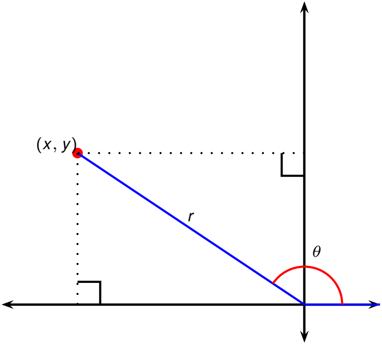


$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

Example ($\tan^2\theta + 1 = \sec^2\theta$)

Prove the identity
$\tan^2\theta + 1 = \sec^2\theta$.

$$\sin^2\theta + \cos^2\theta = 1$$

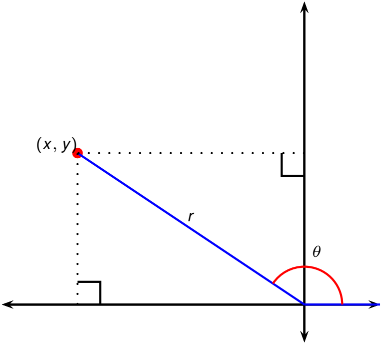


$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

Example ($\tan^2\theta + 1 = \sec^2\theta$)

Prove the identity
$\tan^2\theta + 1 = \sec^2\theta$.

$$\begin{aligned} \sin^2\theta + \cos^2\theta &= 1 \\ \frac{\sin^2\theta}{\cos^2\theta} + \frac{\cos^2\theta}{\cos^2\theta} &= \frac{1}{\cos^2\theta} \end{aligned}$$



$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$

Example ($\tan^2\theta + 1 = \sec^2\theta$)

Prove the identity
$\tan^2\theta + 1 = \sec^2\theta$.

$$\begin{aligned} \sin^2\theta + \cos^2\theta &= 1 \\ \frac{\sin^2\theta}{\cos^2\theta} + \frac{\cos^2\theta}{\cos^2\theta} &= \frac{1}{\cos^2\theta} \\ \tan^2\theta + 1 &= \sec^2\theta \end{aligned}$$
