Definition ($\log_a x$)

The inverse function of $f(x) = a^x$ is called the logarithmic function with base a, and is written $\log_a x$. It is defined by the formula

$$\log_a x = y \qquad \Leftrightarrow \qquad a^y = x.$$

If $x > 0$, then $\log_a x$ is the exponent to which the base a must be raised to give x.

Example

Evaluate:

1. $\log_3 81 =$
2. $\log_{25} 5 =$
3. $\log_{10} 0.001 =$

If $x > 0$, then $\log_a x$ is the exponent to which the base a must be raised to give x.

Example

Evaluate:

1. $\log_3 81 = \mathbf{?}$
2. $\log_{25} 5 = \mathbf{?}$
3. $\log_{10} 0.001 = \mathbf{?}$

If $x > 0$, then $\log_a x$ is the exponent to which the base a must be raised to give x.

Example

Evaluate:

1. $\log_3 81 = 4$ because $3^4 = 81$.
2. $\log_{25} 5 = \mathbf{?}$
3. $\log_{10} 0.001 = \mathbf{?}$

If $x > 0$, then $\log_a x$ is the exponent to which the base a must be raised to give x.

Theorem (Properties of Logarithmic Functions)

If $a > 1$, the function $f(x) = \log_a x$ is a one-to-one, continuous, increasing function with domain $(0, \infty)$ and range $\mathbb{R}$. If $x, y, a, b > 0$ and r is any real number, then

1. $\log_a(xy) = \log_a x + \log_a y$.
2. $\log_a\left(\frac{x}{y}\right) = \log_a x - \log_a y$.
3. $\log_a(x^r) = r \log_a x$.
4. $\log_a(x) = \log_b x \log_a b = \frac{\log_b x}{\log_b a} = \frac{\ln x}{\ln a}$.

Example

Using only the ln and arithmetic operations of your calculator, compute $\log_5(13)$. Confirm your answer by exponentiation.

Recall that $\log_a(x) = \log_b x \log_a b = \frac{\log_b x}{\log_b a} = \frac{\ln x}{\ln a}$.

Example

Using only the ln and arithmetic operations of your calculator, compute $\log_5(13)$. Confirm your answer by exponentiation.

$$\log_5(13) = \frac{\ln 13}{\ln 5} \approx \frac{2.564949357}{1.609437912} \approx 1.593693.$$

As a check of our computations, we compute by calculator:
$13 = 5^{\log_5 13} \approx 5^{1.593693} \approx 13.000007508$, and our computations check out.

Use the properties of logarithms to evaluate the following.
