Inverse Functions One-to-one Functions 4/14

One-to-one Functions

Definition (One-to-one Function)

A function f is a one-to-one function if it never takes on the same value twice; that is,

$$f(x_1) \neq f(x_2)$$
 whenever $x_1 \neq x_2$.

← This function is not one-to-one.

Inverse Functions One-to-one Functions 5/14

Question: How can we tell from the graph of a function whether it is one-to-one or not?

Answer: Use the horizontal line test.

The Horizontal Line Test.

A function is one-to-one if and only if no horizontal line intersects it more than once.

Inverse Functions The Definition of the Inverse of *f* 6/14

The Definition of the Inverse of f

Definition (f^{-1})

Let f be a one-to-one function with domain A and range B. Then the inverse of f is the function f^{-1} that has domain B and range A and is defined by

$$f^{-1}(y) = x \qquad \Leftrightarrow \qquad f(x) = y$$

for all y in B.

Note:

- Only one-to-one functions have inverses.
- f^{-1} reverses the effect of f.
- domain of f^{-1} = range of f.
- range of $f^{-1} = \text{domain of } f$.

Example $(f(x) = x^3)$

The inverse of $f(x) = x^3$ is $f^{-1}(x) = \sqrt[3]{x}$. This is because if $y = x^3$, then

$$f^{-1}(y) = \sqrt[3]{y} = \sqrt[3]{x^3} = x.$$

The inverse of f is denoted as f^{-1} . This notation is one of the most frequent causes of student confusion. **WARNING:**

$$f^{-1}(x)$$
 does not mean $(f(x))^{-1} = \frac{1}{f(x)}$.

The notations are different: the superscript -1 has different positions.

- f^{-1} is the compositional inverse of f.
- $\frac{1}{f(x)}$ is the multiplicative inverse of f(x).
- $f^{2}(x)$ is an abbreviation for $(f(x))^{2}$, $f^{3}(x)$ is an abbreviation of $(f(x))^{3}$, and so on.
- However, $f^{-1}(x)$ is not the abbreviation of $(f(x))^{-1}$ and does not follow this pattern.

$$f^n(x) = \left\{ egin{array}{ll} ext{stands for } (f(x))^n & ext{when } n=1,2,3,\dots \\ ext{stands for inverse of } f ext{ applied to } x & ext{when } n=-1 \\ ext{should be avoided} & ext{when } n
eq -1,1,2,3,\dots. \end{array}
ight.$$

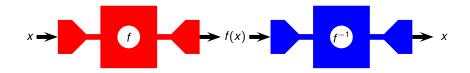

To reduce confusion, if possible, use $\frac{1}{f(x)}$ instead of $(f(x))^{-1}$.

$$\Leftrightarrow$$

$$f^{-1}(y) = x \qquad \Leftrightarrow \qquad f(x) = y.$$

Therefore

$$(f^{-1} \circ f)(x) = f^{-1}(f(x)) = f^{-1}(y) = x.$$

Switch the roles of x and v:

$$f^{-1}(x) = y \qquad \Leftrightarrow \qquad f(y) = x.$$

Therefore

$$(f \circ f^{-1})(x) = f(f^{-1}(x)) = f(y) = x.$$

Inverse Functions The Definition of the Inverse of f 9/14

How to Find the Inverse of a One-to-one Function

- Write y = f(x).
- Solve this equation for x in terms of y (if possible).

Example

If $f(x) = x^3 + 2$, find a formula for $f^{-1}(y)$.

$$y = x^3 + 2$$
$$x^3 = y - 2$$
$$x = \sqrt[3]{y - 2}$$

Therefore $x = f^{-1}(y) = \sqrt[3]{y-2}$. Sometimes we relabel x and y and write $f^{-1}(x) = \sqrt[3]{x-2}$. Whenever in doubt, do not relabel anything.

Example (Guess and Check)

If $f(x) = 2x + \sin 2x + e^{\frac{x}{2}}$, find $f^{-1}(1)$. You do not need to show that fhas an inverse.

$$f(\) = 2(\) + \sin 2(\) + e^{\frac{(\)}{2}}$$

=
= 1.

Therefore $f^{-1}(1) =$

Interchanging x and y suggests relation between the graphs of f^{-1} and f:

- Suppose (a, b) is on the graph of f.
- Then f(a) = b.
- Then $f^{-1}(b) = a$.
- Then (b, a) is on the graph of f^{-1} .
- (b, a) is the reflection of (a, b) in the line y = x.
- Thus the graph of f^{-1} is obtained by reflecting the graph of f in the line y = x.

Example

Sketch the graph of $f(x) = \sqrt{-x-1}$ and its inverse function.

- Draw the graph of $y = \sqrt{x}$.
- $y = \sqrt{-x}$ is the reflection of $y = \sqrt{x}$ in the *y*-axis.
- $y = f(x) = \sqrt{-(x+1)} = \sqrt{-x-1}$ is the shift of $y = \sqrt{-x}$ one unit to the left.
- $y = f^{-1}(x)$ is the reflection of y = f(x) across the line y = x.

Example (

Given: $f(x) = 3x^2 + 4x - 7$ with domain $x \ge -\frac{2}{3}$. Find $f^{-1}(x)$.

Final answer, relabelled:

$$f^{-1}(x) = -\frac{2}{3} + \frac{\sqrt{25 + 3x}}{3}$$

$$3x^2 + 4x - 7 = y$$
$$3x^2 + 4x + (-7 - y) = 0$$

That's a quadratic equation in x. Solve:

$$\frac{-4 \pm \sqrt{4^2 - 4 \cdot 3 \cdot (-y - 7)}}{2 \cdot 3}$$

$$= -\frac{2 \pm \sqrt{25 + 3y}}{3} = -\frac{2}{3} \pm \frac{\sqrt{25 + 3y}}{3}$$

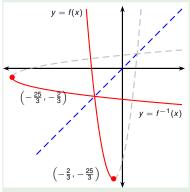

We are given $x \ge -\frac{2}{3}$, therefore

$$\dot{x} = -\frac{2}{3} + \frac{\sqrt{25+3y}}{3} = f^{-1}(y).$$

Todor Milev Inverse functions 2019

Example (What if we change the problem to $x \le -\frac{2}{3}$?)

Given: $f(x) = 3x^2 + 4x - 7$ with domain $x \le -\frac{2}{3}$. Find $f^{-1}(x)$.

Final answer, relabelled:

$$f^{-1}(x) = -\frac{2}{3} - \frac{\sqrt{25 + 3x}}{3}$$

$$3x^2 + 4x - 7 = y$$
$$3x^2 + 4x + (-7 - y) = 0$$

That's a quadratic equation in x. Solve:

$$\frac{-4 \pm \sqrt{4^2 - 4 \cdot 3 \cdot (-y - 7)}}{2 \cdot 3}$$

$$= -\frac{2 \pm \sqrt{25 + 3y}}{3} = -\frac{2}{3} \pm \frac{\sqrt{25 + 3y}}{3}$$

We are given $x \le -\frac{2}{3}$, therefore

$$X = -\frac{2}{3} - \frac{\sqrt{25+3y}}{3} = f^{-1}(y).$$

Example

Find
$$f^{-1}(x)$$
 where $f(x) = \frac{x+1}{x-1}$.

Answer:
$$f^{-1}(x) = \frac{x+1}{x-1}$$
, $x \neq 1$.

We deal with domains and ranges later:

$$y = \frac{x+1}{x-1}$$
 mult. by $(x-1)$
 $y(x-1) = x+1$
 $x(y-1) = y+1$ div. by $(y-1)$
 $f^{-1}(y) = x = \frac{y+1}{y-1}$ relabel x, y
 $f^{-1}(x) = \frac{x+1}{x-1}$

We divided by y - 1 so $y \ne 1$. Therefore the domain of f^{-1} is all real numbers except 1.

Can a non-identity function be its own inverse? Yes, *f* is.

What does it mean for f to be its own inverse? Graph of f is symmetric across y = x.
