Outline

Complex numbers definition

Complex numbers multiplication and addition

Definition (Complex numbers)

The set of complex numbers \mathbb{C} is defined as the set

$$\{a + bi | a, b - \text{real numbers}\},\$$

where the number i is a number for which

$$i^2 = -1$$
.

The number *i* is called the imaginary unit. By definition, $\sqrt{-1} = i$.

Complex addition/subtraction

$$(a + bi) \pm (c + di) = (a \pm c) + (b \pm d)i$$
.

Complex multiplication

$$(a+bi)(c+di) = ac+adi+bci+bdi^2 = ac+adi+bci-bdi$$

= $(ac-bd)+i(ad+bc)$

Let
$$u = 2 + 3i$$
, $v = 5 - 7i$.

Example (Addition)

$$u + v = (2+3i) + (5-7i) = (2+5) + (3-7)i = 7-4i.$$

Example (Subtraction)

$$u - v = (2+3i) - (5-7i) = (2-5) + (3-(-7))i = -3+10i.$$

Example (Multiplication)

$$u \cdot v = (2+3i) \cdot (5-7i)$$

$$= 2 \cdot 5 + 2 \cdot (-7)i + 3i \cdot 5 + 3i(-7i)$$

$$= 10 - 14i + 15i - 21i^{2}$$

$$= 10 + i - (-21)$$

$$= 31 + i$$

Review of the basic types of numbers

• An integer, or whole number, is one of the numbers:

$$\dots, -2, -1, 0, 1, 2, \dots$$

• A rational number is the quotient of two integers, for example:

$$\frac{1}{2}$$
, $\frac{2}{-3} = -\frac{2}{3}$, $\frac{8}{12} = \frac{4}{6} = \frac{2}{3}$

• A real number measures the location of a point on the real line:

$$\sqrt{2} = 1.414213562373095048801688724209698...$$
 $\pi = 3.141592653589793238462643383279502...$
 $e = 2.718281828459045235360287471352662...$

- A number is complex if it equals a + bi with a, b- real, $\sqrt{-1} = i$: 2 + 3i. -i. $1 + \sqrt{2}i$
- Geometric interpretation of complex numbers: beyond our scope.
