Euler's Formula

Theorem (Euler's Formula)

$$e^{ix} = \cos x + i \sin x$$

where $e \approx 2.71828$ is Euler's/Napier's constant.

Proof.

Recall $n! = 1 \cdot 2 \cdot 3 \cdot \cdots \cdot (n-1) \cdot n$. Borrow from Calc II the f-las:

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots + \frac{(-1)^n x^{2n+1}}{(2n+1)!} + \dots$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots + \frac{(-1)^n x^{2n}}{(2n)!} + \dots$$

$$e^{x} = 1 + x + \frac{x^{2}}{2!} + \frac{x^{3}}{3!} + \dots + \frac{x^{n}}{n!} + \dots$$

Euler's Formula

Theorem (Euler's Formula)

$$e^{ix} = \cos x + i \sin x$$

where $e \approx 2.71828$ is Euler's/Napier's constant .

Proof.

Recall $n! = 1 \cdot 2 \cdot 3 \cdot \cdots \cdot (n-1) \cdot n$. Borrow from Calc II the f-las:

$$i\sin x = ix$$
 $-i\frac{x^3}{3!}$ $+i\frac{x^5}{5!}$ $-\dots$

$$cos X = 1 -\frac{x^2}{2!} +\frac{x^4}{4!} + \dots$$

$$e^{ix} = 1 +ix -\frac{x^2}{2!} -i\frac{x^3}{3!} +\frac{x^4}{4!} +i\frac{x^5}{5!} - \dots$$

Rearrange. Plug-in z = ix. Use $i^2 = -1$. Multiply $\sin x$ by i. Add to get $e^{ix} = \cos x + i \sin x$.

Trigonometric Identities Revisited

- $e^{ix} = \cos x + i \sin x$ (Euler's Formula).
- $e^{ix}e^{iy} = e^{ix+iy} = e^{i(x+y)}$ (exponentiation rule: valid for \mathbb{C}). • $e^0 = 1$ (exponentiation rule).
- \circ $\sin(-x) = -\sin x$, $\cos(-x) = \cos x$ (easy to remember).

Example

$$sin(x + y) = sin x cos y + sin y cos x$$

 $cos(x + y) = cos x cos y - sin x sin y$

Proof.

$$e^{i(x+y)} = \cos(x+y) + i\sin(x+y)$$

$$e^{ix}e^{iy} = \cos(x+y) + i\sin(x+y)$$

$$(\cos x + i\sin x)(\cos y + i\sin y) = \cos(x+y) + i\sin(x+y)$$

$$\cos x \cos y - \sin x \sin y + i(\sin x \cos y + \sin y \cos x) = \cos(x+y) + i\sin(x+y)$$

Compare coefficient in front of i and remaining terms to get the desired equalities.

Trigonometric Identities Revisited

- $e^{ix} = \cos x + i \sin x$ (Euler's Formula).
- $e^{ix}e^{iy} = e^{ix+iy} = e^{i(x+y)}$ (exponentiation rule: valid for \mathbb{C}). • $e^0 = 1$ (exponentiation rule).
- $\sin(-x) = -\sin x$, $\cos(-x) = \cos x$ (easy to remember).

Example

$$\sin^2 x + \cos^2 x = 1$$

Proof.

$$1 = e^{0}
= e^{ix-ix} = e^{ix}e^{-ix} = (\cos x + i\sin x)(\cos(-x) + i\sin(-x))
= (\cos x + i\sin x)(\cos x - i\sin x) = \cos^{2} x - i^{2}\sin^{2} x
= \cos^{2} x + \sin^{2} x .$$

Trigonometric Identities Revisited

- $e^{ix} = \cos x + i \sin x$ (Euler's Formula).
- $e^{ix}e^{iy} = e^{ix+iy} = e^{i(x+y)}$ (exponentiation rule: valid for \mathbb{C}). • $e^0 = 1$ (exponentiation rule).
- $\sin(-x) = -\sin x$, $\cos(-x) = \cos x$ (exponentiation rule).

Example

$$sin(2x) = 2 sin x cos x$$

$$cos(2x) = cos^2 x - sin^2 x .$$

Proof.

$$e^{i(2x)} = \cos(2x) + i\sin(2x)$$

$$e^{ix}e^{ix} = \cos(2x) + i\sin(2x)$$

$$(\cos x + i\sin x)^2 = (\cos x + i\sin x)(\cos x + i\sin x) = \cos(2x) + i\sin(2x)$$

$$\cos^2 x - \sin^2 x + i(2\sin x\cos x) = \cos(2x) + i\sin(2x)$$

Compare coefficient in front of *i* and remaining terms to get the desired equalities.
