Calculus II Guess sequence formula, part 1

Todor Miley

2019

Example (Sequences via f-las: guess f-la from terms)

Find a formula for the general term a_n of the sequence

$$\left(0, \frac{1}{4}, -\frac{2}{8}, \frac{3}{16}, -\frac{4}{32}, \frac{5}{64}, \dots\right)$$

$$a_1 = 0, \ a_2 = \frac{1}{4}, \ a_3 = -\frac{2}{8}, \ a_4 = \frac{3}{16}, \ a_5 = -\frac{4}{32}, \ a_6 = \frac{5}{64}, \dots$$

- The numerators start at 0 and go up by one with each term.
- The n^{th} term has numerator n-1.
- The denominators start at 2 and double with each term.
- The n^{th} term has denominator 2^n .
- The signs of the terms alternate between positive and negative.
- We take this into account by multiplying by $(-1)^n$.

$$a_n=(-1)^n\frac{n-1}{2^n}$$
