Outline

1 Factorization overview

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$2x^2 + 3x - 5 \;=$$

$$x^2 + 1 \;=$$

$$x^4 - 1 \;=$$

$$x^4 + 1 \;=$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$2x^2 + 3x - 5 = (\textbf{?}\qquad)(\textbf{?}\qquad)$$

$$x^2 + 1 =$$

$$x^4 - 1 =$$

$$x^4 + 1 =$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$2x^2 + 3x - 5 \;=\; (2x + 5)(x - 1)$$

$$x^2 + 1 \;=\;$$

$$x^4 - 1 \;=\;$$

$$x^4 + 1 \;=\;$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \\
x^2 + 1 &= \\
x^4 - 1 &= \\
\\
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$2x^2 + 3x - 5 = (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1)$$

$$x^2 + 1 = x^2 - (-1)$$

$$x^4 - 1 =$$

$$x^4 + 1 =$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 \\[2mm]
x^4 - 1 &= \\[6mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x+i)(x-i) \\[2mm]
x^4 - 1 &= \\[6mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$2x^2 + 3x - 5 = (2x + 5)(x - 1) = 2\left(x - \left(-\frac{5}{2}\right)\right)(x - 1)$$

$$x^2 + 1 = x^2 - (-1) = x^2 - i^2 = (x + i)(x - i)$$

$$x^4 - 1 =$$

$$x^4 + 1 =$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x + i)(x - i) \\[2mm]
x^4 - 1 &= \\[6mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x+i)(x-i) \\[2mm]
{\color{red} x^4 - 1} &= {\color{red} (x^2-1)(x^2+1)} \\[8mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x + i)(x - i) \\[2mm]
x^4 - 1 &= (x^2 - 1)(x^2 + 1) \\[6mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \\
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x+i)(x-i) \\
x^4 - 1 &= (x^2 - 1)(x^2 + 1) \\
\\
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$2x^2 + 3x - 5 = (2x+5)(x-1) = 2\left(x - \left(-\frac{5}{2}\right)\right)(x-1)$$

$$x^2 + 1 = x^2 - (-1) = x^2 - i^2 = (x+i)(x-i)$$

$$x^4 - 1 = (x^2 - 1)(x^2 + 1)$$

$$x^4 + 1 =$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1) \\
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x+i)(x-i) \\
x^4 - 1 &= (x^2 - 1)(x^2 + 1) = (x-1)(x+1)(x^2+1) \\
\\
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$2x^2 + 3x - 5 = (2x + 5)(x - 1) = 2\left(x - \left(-\frac{5}{2}\right)\right)(x - 1)$$

$$x^2 + 1 = x^2 - (-1) = x^2 - i^2 = (x + i)(x - i)$$

$$x^4 - 1 = (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1)$$

$$x^4 + 1 =$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x + i)(x - i) \\[2mm]
x^4 - 1 &= (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1) \\[4mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x + i)(x - i) \\[2mm]
x^4 - 1 &= (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1) \\[6mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x+i)(x-i) \\[2mm]
x^4 - 1 &= (x^2 - 1)(x^2 + 1) = (x-1)(x+1)(x^2+1) \\[2mm]
&= (x-1)(x+1)(x-i)(x+i) \\[2mm]
x^4 + 1 &=
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1) \\
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x+i)(x-i) \\
x^4 - 1 &= (x^2 - 1)(x^2 + 1) = (x-1)(x+1)(x^2+1) \\
&= (x-1)(x+1)(x-i)(x+i) \\
x^4 + 1 &= \left(x^2 - \sqrt{2}x + 1\right)\left(x^2 + \sqrt{2}x + 1\right)
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$
\begin{aligned}
2x^2 + 3x - 5 &= (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x + i)(x - i) \\[2mm]
x^4 - 1 &= (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1) \\[2mm]
&= (x - 1)(x + 1)(x - i)(x + i) \\[2mm]
x^4 + 1 &= \left(x^2 - \sqrt{2}x + 1\right)\left(x^2 + \sqrt{2}x + 1\right) \\[2mm]
&= \left(x - \left(\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right) \\[2mm]
&\quad \left(x - \left(-\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)
\end{aligned}
$$

Recall that $i^2 = -1$, $\sqrt{-1} = i$.

Example (Polynomial factorizations)

$$\begin{aligned}
2x^2 + 3x - 5 &= (2x+5)(x-1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x-1) \\[2mm]
x^2 + 1 &= x^2 - (-1) = x^2 - i^2 = (x+i)(x-i) \\[2mm]
x^4 - 1 &= (x^2-1)(x^2+1) = (x-1)(x+1)(x^2+1) \\[2mm]
&= (x-1)(x+1)(x-i)(x+i) \\[2mm]
x^4 + 1 &= \left(x^2 - \sqrt{2}\,x + 1\right)\left(x^2 + \sqrt{2}\,x + 1\right) \\[2mm]
&= \left(x - \left(\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right) \\[2mm]
&\quad \left(x - \left(-\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)
\end{aligned}$$

Theorem (The Fundamental Theorem of Algebra)

Every polynomial can be factored into product of linear terms

$$p(x) = a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1)\ldots(x - x_n),$$

where $x_1, \ldots, x_n$ are the (not necessarily different) roots of $p(x)$.

Theorem (The Fundamental Theorem of Algebra)

Every polynomial can be factored into product of linear terms

$$p(x) = a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n),$$

where $x_1, \ldots, x_n$ are the (not necessarily different) roots of $p(x)$.

- Every pol. of deg. n can be factored as product of n linear factors.

Theorem (The Fundamental Theorem of Algebra)

Every polynomial can be factored into product of linear terms

$$p(x) = a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n),$$

where $x_1, \ldots, x_n$ are the (not necessarily different) roots of $p(x)$.

- Every pol. of deg. *n* can be factored as product of *n* linear factors.

Theorem (The Fundamental Theorem of Algebra)

Every polynomial can be factored into product of linear terms

$$p(x) = a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0 (x - x_1) \ldots (x - x_n),$$

where $x_1, \ldots, x_n$ are the (not necessarily different) roots of $p(x)$.

- Every pol. of deg. *n* can be factored as product of *n* linear factors.

Theorem (The Fundamental Theorem of Algebra)

Every polynomial can be factored into product of linear terms

$$p(x) = a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n),$$

where $x_1, \ldots, x_n$ are the (not necessarily different) roots of $p(x)$.

- Every pol. of deg. n can be factored as product of n linear factors.
- $x_1, \ldots, x_n$ may be complex numbers. Reminder: complex numbers are of the form $p + qi$, where $i^2 = -1$ and $\sqrt{-1} = i$.

Theorem (The Fundamental Theorem of Algebra)

Every polynomial can be factored into product of linear terms

$$p(x) = a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n),$$

where $x_1, \ldots, x_n$ are the (not necessarily different) roots of $p(x)$.

- Every pol. of deg. n can be factored as product of n linear factors.
- $x_1, \ldots, x_n$ may be complex numbers. Reminder: complex numbers are of the form $p + qi$, where $i^2 = -1$ and $\sqrt{-1} = i$.
- While we can find $x_1, \ldots x_n$ with arbitrary precision, there may not exist a formula involving radicals for computing each $x_1, \ldots, x_n$.

Theorem (The Fundamental Theorem of Algebra)

where $x_1, \ldots, x_n$ are the (not necessarily different) roots of $p(x)$.

- $x_1, \ldots, x_n$ may be complex numbers. Reminder: complex numbers are of the form $p + qi$, where $i^2 = -1$ and $\sqrt{-1} = i$.

Corollary

Every real polynomial can be factored into a product of real linear terms and real quadratic terms with no real roots, i.e., factors of form

- $(x - r)$, *where r is real and*
- $ax^2 + bx + c$ *with $b^2 - 4ac < 0$ where a, b, c are real.*

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$
$$= \text{prod. real quadratics no roots \& lin. terms.}$$

Example

$$2x^2 + 3x - 5 = (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1)$$

$$x^2 + 1 = x^2 - (-1) = x^2 - i^2 = (x - (-i))(x - i)$$

$$x^4 - 1 = (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1)$$

$$= (x - 1)(x - (-1))(x - i)(x - (-i))$$

$$x^4 + 1 = (x^2 - \sqrt{2}x + 1)(x^2 + \sqrt{2}x + 1)$$

$$= \left(x - \left(\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$\left(x - \left(-\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1)\ldots(x - x_n)$$
$$= \text{prod. real quadratics no roots \& lin. terms.}$$

Example

$$2x^2 + 3x - 5 = (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \quad \bigg| \quad \text{real roots}$$

$$x^2 + 1 = x^2 - (-1) = x^2 - i^2 = (x - (-i))(x - i)$$

$$x^4 - 1 = (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1)$$

$$= (x - 1)(x - (-1))(x - i)(x - (-i))$$

$$x^4 + 1 = (x^2 - \sqrt{2}x + 1)(x^2 + \sqrt{2}x + 1)$$

$$= \left(x - \left(\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$\left(x - \left(-\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$
$$= \text{prod. real quadratics no roots \& lin. terms.}$$

Example

$$2x^2 + 3x - 5 = (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \quad \Big| \quad \text{real roots}$$

$$x^2 + 1 = x^2 - (-1) = x^2 - i^2 = (x - (-i))(x - i)$$

$$x^4 - 1 = (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1)$$

$$= (x - 1)(x - (-1))(x - i)(x - (-i))$$

$$x^4 + 1 = (x^2 - \sqrt{2}x + 1)(x^2 + \sqrt{2}x + 1)$$

$$= \left(x - \left(\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$\left(x - \left(-\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$
$$= \text{prod. real quadratics no roots \& lin. terms.}$$

Example

$$2x^2 + 3x - 5 = (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \quad \bigg| \quad \text{real roots}$$

$$\color{red}{x^2 + 1 = x^2 - (-1) = x^2 - i^2 = (x - (-i))(x - i)} \quad \bigg| \quad \color{red}{\text{complex roots}}$$

$$x^4 - 1 = (x^2 - 1)(x^2 + 1) = (x - 1)(x + 1)(x^2 + 1)$$

$$= (x - 1)(x - (-1))(x - i)(x - (-i))$$

$$x^4 + 1 = (x^2 - \sqrt{2}x + 1)(x^2 + \sqrt{2}x + 1)$$

$$= \left(x - \left(\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$\left(x - \left(-\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0 (x - x_1) \ldots (x - x_n)$$
$$= \text{prod. real quadratics no roots \& lin. terms.}$$

Example

$$2x^2 + 3x - 5 = (2x + 5)(x - 1) = 2\left(x - \left(-\tfrac{5}{2}\right)\right)(x - 1) \quad \Big| \quad \text{real roots}$$

$$= \left(x - \left(\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right)$$

$$\left(x - \left(-\tfrac{\sqrt{2}}{2} + \tfrac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\tfrac{\sqrt{2}}{2} - \tfrac{\sqrt{2}}{2}i\right)\right) \quad \Big| \quad \text{complex roots}$$

Factoring polynomials in practice

- In theory every polynomial can be factored.

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$

Factoring polynomials in practice

- In theory every polynomial can be factored.

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1)\ldots(x - x_n)$$

- Theory guarantees numerical approximations for roots $x_1, \ldots, x_n$.

Factoring polynomials in practice

- In theory every polynomial can be factored.

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$

- Theory guarantees numerical approximations for roots $x_1, \ldots, x_n$.
- Can we find algebraic formulas for $x_1, \ldots, x_n$?

Factoring polynomials in practice

- In theory every polynomial can be factored.

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0 (x - x_1) \ldots (x - x_n)$$

- Theory guarantees numerical approximations for roots $x_1, \ldots, x_n$.
- Can we find algebraic formulas for $x_1, \ldots, x_n$?
- No, if using finitely many operations $+, -, *, /, \sqrt[n]{}$.

Factoring polynomials in practice

- In theory every polynomial can be factored.

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0 (x - x_1) \ldots (x - x_n)$$

- Theory guarantees numerical approximations for roots $x_1, \ldots, x_n$.
- Can we find algebraic formulas for $x_1, \ldots, x_n$?
- No, if using finitely many operations $+, -, *, /, \sqrt[n]{\ }$.
- First (advanced) proof by Norwegian Niels Henrik Abel(1824) based on work of Italian Paolo Ruffini(1799).

Factoring polynomials in practice

- In theory every polynomial can be factored.

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1)\ldots(x - x_n)$$

- Theory guarantees numerical approximations for roots $x_1, \ldots, x_n$.
- Can we find algebraic formulas for $x_1, \ldots, x_n$?
- No, if using finitely many operations $+, -, *, /, \sqrt[n]{\ }$.
- First (advanced) proof by Norwegian Niels Henrik Abel(1824) based on work of Italian Paolo Ruffini(1799).
- Yes, with extra operations. Difficult: google Galois Theory to get started.

What does factorization mean?

- Based on context, "to factor a polynomial" means one of:

These poly's are equal	Type of factorization
$x^4 + 1$	
$(x^2 - \sqrt{2}x + 1)(x^2 + \sqrt{2}x + 1)$	
$\left(x - \left(\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i\right)\right)$ $\left(x - \left(\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i\right)\right)$	

What does factorization mean?

- Based on context, "to factor a polynomial" means one of:
  - Factor the polynomial over the rational numbers. Use integers/quotients, but no $\sqrt[n]{}$).

These poly's are equal	Type of factorization
$x^4 + 1$	factored over rationals
$(x^2 - \sqrt{2}x + 1)(x^2 + \sqrt{2}x + 1)$	
$\left(x - \left(\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i\right)\right)$ $\left(x - \left(\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i\right)\right)\left(x - \left(-\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i\right)\right)$	

What does factorization mean?

- Based on context, "to factor a polynomial" means one of:
  - Factor the polynomial over the rational numbers. Use integers/quotients, but no $\sqrt[n]{\ }$).

These poly's are equal	Type of factorization
$x^4 + 1$	factored over rationals

Factorization over the rationals

- Suppose we want to factor a polynomial using only rational numbers (no $\sqrt[n]{}$ or numerical approximations).

Factorization over the rationals

- Suppose we want to factor a polynomial using only rational numbers (no $\sqrt[n]{}$ or numerical approximations).
- No guarantee to get:

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$

Factorization over the rationals

- Suppose we want to factor a polynomial using only rational numbers (no $\sqrt[n]{}$ or numerical approximations).
- No guarantee to get:

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1)\ldots(x - x_n)$$

- A factorization using rationals may have arbitrarily large factors.

Factorization over the rationals

- Suppose we want to factor a polynomial using only rational numbers (no $\sqrt[n]{}$ or numerical approximations).
- No guarantee to get:

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$

- A factorization using rationals may have arbitrarily large factors.
- Efficient algorithms for factoring using rationals exist.

Factorization over the rationals

- Suppose we want to factor a polynomial using only rational numbers (no $\sqrt[n]{}$ or numerical approximations).
- No guarantee to get:

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0(x - x_1) \ldots (x - x_n)$$

- A factorization using rationals may have arbitrarily large factors.
- Efficient algorithms for factoring using rationals exist.
  - Kronecker algorithm (German Leopold Kronecker (1823-1891)).

Factorization over the rationals

- Suppose we want to factor a polynomial using only rational numbers (no $\sqrt[n]{}$ or numerical approximations).
- No guarantee to get:

$$a_0 x^n + a_1 x^{n-1} + \cdots + a_n = a_0 (x - x_1) \ldots (x - x_n)$$

- A factorization using rationals may have arbitrarily large factors.
- Efficient algorithms for factoring using rationals exist.
  - Kronecker algorithm (German Leopold Kronecker (1823-1891)).
  - Methods based on finite fields.

Factorization over the rationals

- Suppose we want to factor a polynomial using only rational numbers (no $\sqrt[n]{}$ or numerical approximations).
