Calculus II
Decimal notation to rational number

Todor Milev

2019

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.

$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.

$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.

$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.

$$2.317171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a =$ \qquad and $r =$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.

$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r =$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r =$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\ldots \quad = \quad 2.3 + \frac{}{1 - }$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\ldots = 2.3 + \frac{\frac{17}{10^3}}{1 -}$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.

$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\ldots = 2.3 + \frac{\frac{17}{10^3}}{1 - }$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\ldots = 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}}$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\ldots \quad = \quad 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}} = 2.3 + \frac{\frac{17}{1000}}{\frac{99}{100}}$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$
\begin{aligned}
2.3171717\ldots &= 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}} = 2.3 + \frac{\frac{17}{1000}}{\frac{99}{100}} \\
&= \frac{23}{10} + \frac{17}{990}
\end{aligned}
$$

Example

Write the number $2.3\overline{17} = 2.3171717\ldots$ as a quotient of integers.
$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$
\begin{aligned}
2.3171717\ldots &= 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}} = 2.3 + \frac{\frac{17}{1000}}{\frac{99}{100}} \\
&= \frac{23}{10} + \frac{17}{990} = \frac{1147}{495}
\end{aligned}
$$
