

Calculus II

Decimal notation to rational number

Todor Milev

2019

Example

Write the number $2.\overline{317} = 2.3171717 \dots$ as a quotient of integers.

Example

Write the number $2.\overline{317} = 2.3171717 \dots$ as a quotient of integers.

$$2.3171717 \dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

Example

Write the number $2.3\overline{17} = 2.3171717\dots$ as a quotient of integers.

$$2.3\overline{17} = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

Example

Write the number $2.3\overline{17} = 2.3171717\dots$ as a quotient of integers.

$$2.3\overline{17} = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

Example

Write the number $2.3\overline{17} = 2.3171717\dots$ as a quotient of integers.

$$2.317\overline{17}17\dots = 2.3 + \frac{17}{10^3} + \frac{\overline{17}}{10^5} + \frac{17}{10^7} + \dots$$

Example

Write the number $2.3\overline{17} = 2.3171717\dots$ as a quotient of integers.

$$2.31717\overline{17}\dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{\overline{17}}{\overline{10^7}} + \dots$$

Example

Write the number $2.\overline{317} = 2.3171717 \dots$ as a quotient of integers.

$$2.3171717 \dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.

Example

Write the number $2.\overline{317} = 2.3171717 \dots$ as a quotient of integers.

$$2.3171717 \dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a =$ and $r =$

Example

Write the number $2.\overline{317} = 2.3171717 \dots$ as a quotient of integers.

$$2.3171717 \dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r =$

Example

Write the number $2.\overline{317} = 2.3171717 \dots$ as a quotient of integers.

$$2.3171717 \dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r =$

Example

Write the number $2.\overline{317} = 2.3171717 \dots$ as a quotient of integers.

$$2.3171717 \dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

Example

Write the number $2.\overline{317} = 2.3171717\dots$ as a quotient of integers.

$$2.3171717\dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\dots = 2.3 + \frac{\quad}{1 - \quad}$$

Example

Write the number $2.\overline{317} = 2.3171717\dots$ as a quotient of integers.

$$2.3171717\dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\dots = 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}}$$

Example

Write the number $2.\overline{317} = 2.3171717\dots$ as a quotient of integers.

$$2.3171717\dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\dots = 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}}$$

Example

Write the number $2.\overline{317} = 2.3171717\dots$ as a quotient of integers.

$$2.3171717\dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\dots = 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}}$$

Example

Write the number $2.\overline{317} = 2.3171717\ldots$ as a quotient of integers.

$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$2.3171717\ldots = 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}} = 2.3 + \frac{\frac{17}{1000}}{\frac{99}{100}}$$

Example

Write the number $2.\overline{317} = 2.3171717\dots$ as a quotient of integers.

$$2.3171717\dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$\begin{aligned} 2.3171717\dots &= 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}} = 2.3 + \frac{\frac{17}{1000}}{\frac{99}{100}} \\ &= \frac{23}{10} + \frac{17}{990} \end{aligned}$$

Example

Write the number $2.\overline{317} = 2.3171717\dots$ as a quotient of integers.

$$2.3171717\dots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \dots$$

- After the first term, we have a geometric series.
- $a = \frac{17}{10^3}$ and $r = \frac{1}{10^2}$.

$$\begin{aligned} 2.3171717\dots &= 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}} = 2.3 + \frac{\frac{17}{1000}}{\frac{99}{100}} \\ &= \frac{23}{10} + \frac{17}{990} = \frac{1147}{495} \end{aligned}$$
